TUSB422 USB Type-C™ Port Control with Power Delivery

1 Features

- Supports USB Type-C™ 1.2 and Power Delivery (PD) Specifications
- USB PD Phy with I^2C Interface (TCPCi) Supporting:
  - 5 — 24 V Power Sourcing and Sinking
  - 2.5 Watt VCONN switch
  - Alt Mode Negotiations
- Optimized for Portable Applications with Autonomous Dual Role Port (DRP) Support
- Software Configurable as Dedicated Host, Dedicated Device, or Dual-Role
  - DFP, UFP and DRP
  - Attach/Detach of USB port
  - Cable Orientation Detection
  - Current Mode Advertisement and Detection
  - Debug and Audio Accessory Support
  - Active Cable Detection
  - VCONN for Active Cable
- Dead Battery Support
- Integrated over-temperature sensing diode (OTSD)
- VBUS Detect and Discharge Control
- VDD Supply Voltage: 2.7 V — 5.5 V
- Low Current Consumption
- Industrial Temperature Range of –40°C to 85°C

2 Applications

- Smartphones
- Tablets, Notebooks, Desktops
- Wall Charger, Power Banks

3 Description

TUSB422 is a USB PD PHY that enables a USB Type-C port with the Configuration Channel (CC) logic needed for USB Type-C ecosystems. It integrates the physical layer of the USB BMC power delivery (PD) protocol to allow up to 100-W of power and support for alternate mode interfaces. An external microprocessor, containing USB Type-C Port Manager (TCPM), communicates with the TUSB422 through an I^2C interface.

Under control of the TCPM, TUSB422 uses the CC pins to determine port attach/detach, cable orientation, role detection, and port control for USB Type-C current mode. The TUSB422 can be configured as DFP, UFP, or DRP, depending on the application. The TUSB422 implements VBUS detection and discharge for the implementation of a compliant USB Type-C port.

The TUSB422 integrates 2.5 Watt switch to provide VCONN power for an active cable. The device also provides VCONN discharge function. The TUSB422 also supports USB Type-C optional features such as audio and debug accessory.

The device operates over a wide supply-range and has low power consumption. The TUSB422 is available in industrial temperature ranges.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TUSB422	WCSP (9)	1.335mm x 1.380mm at 0.4mm pitch

(1) For all available packages, see the orderable addendum at the end of the data sheet.

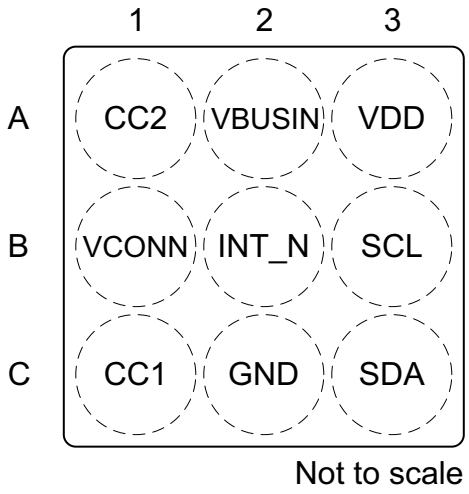
5 Pin Configuration and Functions

YFF Package
9 Pin (DSBGA)
Top View



Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
A1	CC2	I/O (FS)	Type-C Configuration channel signal 2. Used for connector orientation, connection detection and removal, current capabilities, and PD communication. This pin requires an external $C_{RX(SHUNT)}$ capacitor.
A2	VBUSIN	I	5-24 V VBUS input voltage. Tie directly to VBUS at Type-C connector.
A3	VDD	P	2.7 V to 5.5 V Positive supply voltage
B1	VCONN	P	2.7 V to 5.5 V VCONN. VCONN voltage should be at a valid stable value before software closes the VCONN switch.
B2	INT_N	O (FS)	Open drain output. Asserted low to indicate status change occurred. Requires an external pull-up resistor.
B3	SCL	I/O Open-drain (FS)	SCL - I2C communication clock signal. Requires an external pull-up resistor.
C1	CC1	I/O (FS)	Type-C Configuration channel signal 1. Used for connector orientation, connection detection and removal, current capabilities, and PD communication. This pin requires an external $C_{RX(SHUNT)}$ capacitor.
C2	GND	G	Ground
C3	SDA	I/O Open-drain (FS)	SDA - I2C communication data signal. Requires an external pull-up resistor.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Supply Voltage	VDD	-0.3	6	V
VCONN Switch voltage	VCONN	-0.3	6	V
Control pins	INT_N, SDA, SCL	-0.3	6	V
	CC1, CC2	-0.3	6	V
	VBUSIN	-0.3	26	V
Storage temperature, T_{stg}		-65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±1500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{DD}	Supply voltage range	2.7	3.7	5.5	V
VCONN	VCONN voltage range	2.7	5	5.5	V
VBUSIN	System VBUS voltage	0	5	24	V
V_{I2C_SYS}	System I2C voltage range that SDA and SCL are pulled up to	1.65	1.8	3.6	V
T_A	Operating Free air temperature with VCONN not supported in the system	-40	25	105	°C
	Operating Free air temperature with VCONN supported in the system	-40	25	85	°C
T_J	Junction temperature	-40		125	°C

6.4 Thermal Information

THERMAL METRIC[1]		TUSB422 YFF (DSBGA) 9 PINS	UNIT
$R_{\Theta JA}$	Junction-to-ambient thermal resistance	114.3	°C/W
$R_{\Theta JC(top)}$	Junction-to-case (top) thermal resistance	0.7	°C/W
$R_{\Theta JB}$	Junction-to-board thermal resistance	24.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	24.9	°C/W
$R_{\Theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	NA	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, SPRA953.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power Consumption						
$I_{(UNATTACHED\_UFP)}$	UFP Current consumption in Unattached.SNK when port is unconnected and waiting for connection	VDD = 3.7V		10		µA
$I_{(UNATTACHED\_DRP)}$	DRP Current consumption while toggling between Unattached.SNK and Unattached.SRC when port is unconnected and waiting for connection.	VDD = 3.7V		12		µA
$I_{(UNATTACHED\_DFP)}$	DFP Current consumption in Unattached.SRC when port is unconnected and waiting for connection	VDD = 3.7V		11		µA
$I_{(ACTIVE\_UFP)}$	UFP Current consumption in attached.SNK Active Mode. PD Disabled.	VDD = 3.7V		330		µA
$I_{(ACTIVE\_UFP\_PD)}$	UFP current consumption in attached.SNK with PD enabled and transmitting continuous BIST Carrier Mode 2.	VDD = 3.7V; TX_CARRIER_MODE2_SEL = 1;		5.2		mA
CC pins (CC1 and CC2)						
$V_{CC(USB\_DB)}$	Voltage on both CC pins when in dead battery and the attached DFP is presenting default current advertisement	VDD = 0V	0.25		1.5	V
$V_{CC(MED\_DB)}$	Voltage on both CC pins when in dead battery and the attached DFP is presenting medium current (1.5A) advertisement	VDD = 0V	0.45		1.5	V
$V_{CC(HIGH\_DB)}$	Voltage on both CC pins when in dead battery and the attached DFP is presenting high current (3.0A) advertisement	VDD = 0V	0.88		2.18	V
$R_{(CC\_RD)}$	Pull-down resistor when in UFP or DRP mode	VDD = 2.7V to 5.5V	4.6	5.1	5.6	kΩ
$R_{(CC\_RA)}$	Pull-down resistor for active cable	VDD = 2.7V to 5.5V	0.8	1	1.2	kΩ
$I_{CC(LKG)}$	Leakage current through CC pins	VDD = 0V; VCONN = 0V; CC pin = 5.5V			1.36	mA
$V_{(UFP\_CC\_USB)}$	Voltage level range for detecting a DFP attach when configured as a UFP and DFP is advertising default current source capability		0.25		0.61	V

Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{(UFP\_CC\_MED)}$	Voltage level range for detecting a DFP attach when configured as a UFP and DFP is advertising medium (1.5A) current source capability		0.7		1.16	V
$V_{(UFP\_CC\_HIGH)}$	Voltage level range for detecting a DFP attach when configured as a UFP and DFP is advertising high (3.0A) current source capability		1.31		2.04	V
$V_{TH(DFP\_CC\_USB)}$	Voltage threshold for detecting a UFP attach when TUSB422 is advertising default current source capability.		1.51	1.6	1.64	V
$V_{TH(DFP\_CC\_MED)}$	Voltage threshold for detecting a UFP attach when TUSB422 is advertising medium current (1.5A) source capability.		1.51	1.6	1.64	V
$V_{TH(DFP\_CC\_HIGH)}$	Voltage threshold for detecting a UFP attach when TUSB422 is advertising high current (3.0A) source capability.		2.46	2.6	2.74	V
$V_{TH(AC\_CC\_USB)}$	Voltage threshold for detecting a active cable attach when advertising default current		0.15	0.2	0.25	V
$V_{TH(AC\_CC\_MED)}$	Voltage threshold for detecting a active cable attach when advertising medium current		0.35	0.4	0.45	V
$V_{TH(AC\_CC\_HIGH)}$	Voltage threshold for detecting a active cable attach when advertising high current.		0.76	0.8	0.84	V
$I_{CC(DEFAULT\_P)}$	Default mode pull-up current source when advertising default current.		64	80	96	µA
$I_{CC(MED\_P)}$	Medium (1.5A) mode pull-up current source when advertising medium current.		166	180	194	µA
$I_{CC(HIGH\_P)}$	High (3.0A) mode pull-up current source when advertising high current.	VDD > 3.0V	304	330	356	µA
$R_{TX(PD)}$	Output impedance of CC1/CC2 during TX when operating in PD mode and driving the CC line.	At 750KHz	33	48	75	Ω
$R_{TX(FRS\_PD)}$	Fast Role Swap request transmit driver resistance (excluding cable resistance)				5	Ω
$V_{OH(PD)}$	Transmit high voltage when operating in PD mode		1.05	1.125	1.2	V
$V_{OL(PD)}$	Transmit low voltage when operating in PD mode.				0.07	V
$R_{RX(PD)}$	Receiver input impedance. Does Not include pull-up or pulldown resistance from cable detect.	TX is Hi-Z	1			MΩ
$V_{RX(FRS\_PD)}$	Fast role swap request voltage detection threshold		0.49	0.52	0.55	V
$V_{IH(PD\_SRC)}$	Input high voltage when sourcing power. Selected when POWER_ROLE = 1.		0.8925		1.5325	V
$V_{IH(PD\_SNK)}$	Input high voltage when sinking power. Selected when POWER_ROLE = 0.		0.6425		1.5325	V
$V_{IL(PD\_SRC)}$	Input low voltage when sourcing power. Selected when POWER_ROLE = 1.		-0.3325		0.4825	V

Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{IL(PD\_SNK)}$	Input low voltage when sinking power. Selected when POWER_ROLE = 0.		-0.3325		0.2325	V
$C_{RX(SHUNT)}$	External shunt capacitance on both CC1 and CC2.		200		450	pF
Control pins: INT_N						
$I_{(INTN\_LEAK)}$	INT_N leakage	VDD = 0V; 0 < INT_N < 3.3V	-1		1	µA
V_{OL}	Low-level signal output voltage	IOL = -2mA			0.4	V
I2C (SDA and SCL). VDD must be above 3V to operate at 3.3V I2C levels						
$V_{IH(I2C)}$	High-level input signal voltage		1.2			V
$V_{IL(I2C)}$	Low-level input signal voltage				0.4	V
$V_{OL(I2C)}$	Low-level signal output voltage (open-drain)				0.4	V
$I_{OL(I2C)}$	Low level output current		6			mA
$I_{(I2C\_LKG)}$	Leakage through SDA and SCL pins	VDD = 0V; pin pulled up to 3.6V	-1		1	µA
$C_{(I2C)}$	Capacitance for SDA and SCL pins				10	pF
$C_{(I2C\_FM+\_BUS)}$	I2C bus capacitance for FM+ (1MHz)				150	pF
$C_{(I2C\_FM\_BUS)}$	I2C bus capacitance for FM (400KHz)				150	pF
$R_{(EXT\_I2C\_FM+)}$	External resistors on both SDA and SCL when operating at FM+ (1MHz)	$C_{(I2C\_FM+\_BUS)}$ = 150pF	620	820	910	Ω
$R_{(EXT\_I2C\_FM)}$	External resistors on both SDA and SCL when operating at FM (400KHz)	$C_{(I2C\_FM\_BUS)}$ = 150pF	620	1500	2200	Ω
VCONN						
$R_{DS(ON)}$	ON resistance of the VCONN power FET.			0.4	0.75	Ω
$V_{(PASS)}$	Voltage to pass through VCONN power FET				5	V
$I_{(VCONN)}$	VCONN current limit; VCONN is disconnected above this voltage.		500	650	850	mA
$V_{(VCONN\_PRES)}$	Threshold for detecting Vconn present.		2		2.4	V
$C_{(VCONN)}$	Bulk capacitance on VCONN; Placed on VCONN pin supply		10		200	µF
$R_{(VCONN\_DIS)}$	Resistance to GND when Vconn discharge is enabled		4.6	5.1	5.6	KΩ
VBUSIN						
$C_{(BULK\_SRC)}$	Source External bulk capacitance when operating as VBUS Source.		10		150	µF
$C_{(SNK)}$	Sink External bulk capacitance on VBUS at connector		1		10	µF
$C_{(SNKPD)}$	Sink External bulk capacitance on VBUS after success PD negotiation		1		100	µF
$R_{(BLEED)}$	Resistance to gnd when bleed discharge is enabled		8	10	12.5	KΩ
$V_{(SRCSLEWNEG)}$	VBUS discharge maximum slew rate				-30	mV/µs
$V_{(VBUS\_MEASURE\_ACC)}$	VBUS_VOLTAGE register measurement accuracy		-2		2	%
OTSD						
$T_{(OTSD1)}$	TJ over temperature trip threshold resulting in VCONN turn off and flag set.			150		°C

6.6 Timing Requirements

			MIN	NOM	MAX	UNIT
CC pins in PD mode						
F_{br_PD}	Bit Rate		270	300	330	Kbps
t_{UI_PD}	Unit Interval		3.03	3.3	3.7	µs
t_{RISE_PD}	Rise time	10% to 90%; $C_{RX(SHUNT)}$ = 200pF	300			ns
t_{FALL_PD}	Fall time	90% to 10%; $C_{RX(SHUNT)}$ = 200pF	300			ns
$t_{RxFilter}$	Rx Bandwidth limiting filter		100			ns
$t_{InterFrameCap}$	Time from the end of last bit of a frame until the state of the first bit of the next pre-amble		25		50	µs
$t_{StartDrive}$	Time before the start of the first bit of the preamble when the transmitter shall start driving the line.		-1		1	µs
$t_{EndDriveBMC}$	Time to cease driving the line after the end of the last bit of a frame				23	µs
$t_{HoldLowBMC}$	Time to cease driving the line after the final high-to-low transition		1		23	µs
nTransitionCount	Transitions for signal detect	Number of transitions to be detected to declare bus non-idle	3			
$t_{FRSWAPTX}$	Fast Role Swap request transmit duration		60		120	µs
$t_{FRSWAPRX}$	Fast Role Swap detection time		30		50	µs
I2C (SDA and SCL)						
FSCL	SCL clock frequency		0.001		1	MHz
tHD;STA	Hold time (repeated) start condition		0.26			µs
tLOW	Low period of SCL		0.5			µs
tHIGH	High period of SCL		0.26			µs
tSU;STA	Setup time for a repeated start condition		0.26			µs
tHD;DAT	Data Hold Time		0			µs
tSU;DAT	Data setup time		50			µs
tSU;STOP	Setup time for STOP condition		0.26			µs
tBUF	Bus free time between STOP and START condition		0.5			µs
tVD;DAT	Data valid time				0.45	µs
tVD;ACK	Data valid acknowledge time				0.45	µs
tR_I2C	Rise time of both SDA and SCL	30% to 70%			120	ns
tF_I2C	Fall time of both SDA and SCL	70% to 30%	14		120	ns
VCONN Fault						
$t_{VCONN\_FAULT\_DLY}$	Delay from Vconn fault detected to Vconn fault status flag set				20	µs
t_{VCONN_OPEN}	Delay from Vconn fault detected to Vconn switch opened				50	ns
Power-Up Requirements						
$t_{INT\_N\_LOW}$	Time from VDD (min) to TUSB422 asserts INT_N low.	Measured from VDD(min) to INT_N pin at VOL(min).			4	ms
t_{VDD_RISE}	VDD rise time	Measured from 0V to VDD(min)			40	ms
Sampling timings						
$t_{CC\_SAMPLE\_RATE}$	Delay from Vconn fault detected to Vconn fault status flag set	CC_SAMPLE_RATE = 2'b01		2		ms
$t_{VBUSINRATE}$	The sampling interval of VBUS Voltage	CC_SAMPLE_RATE = 2'b01			2.2	ms

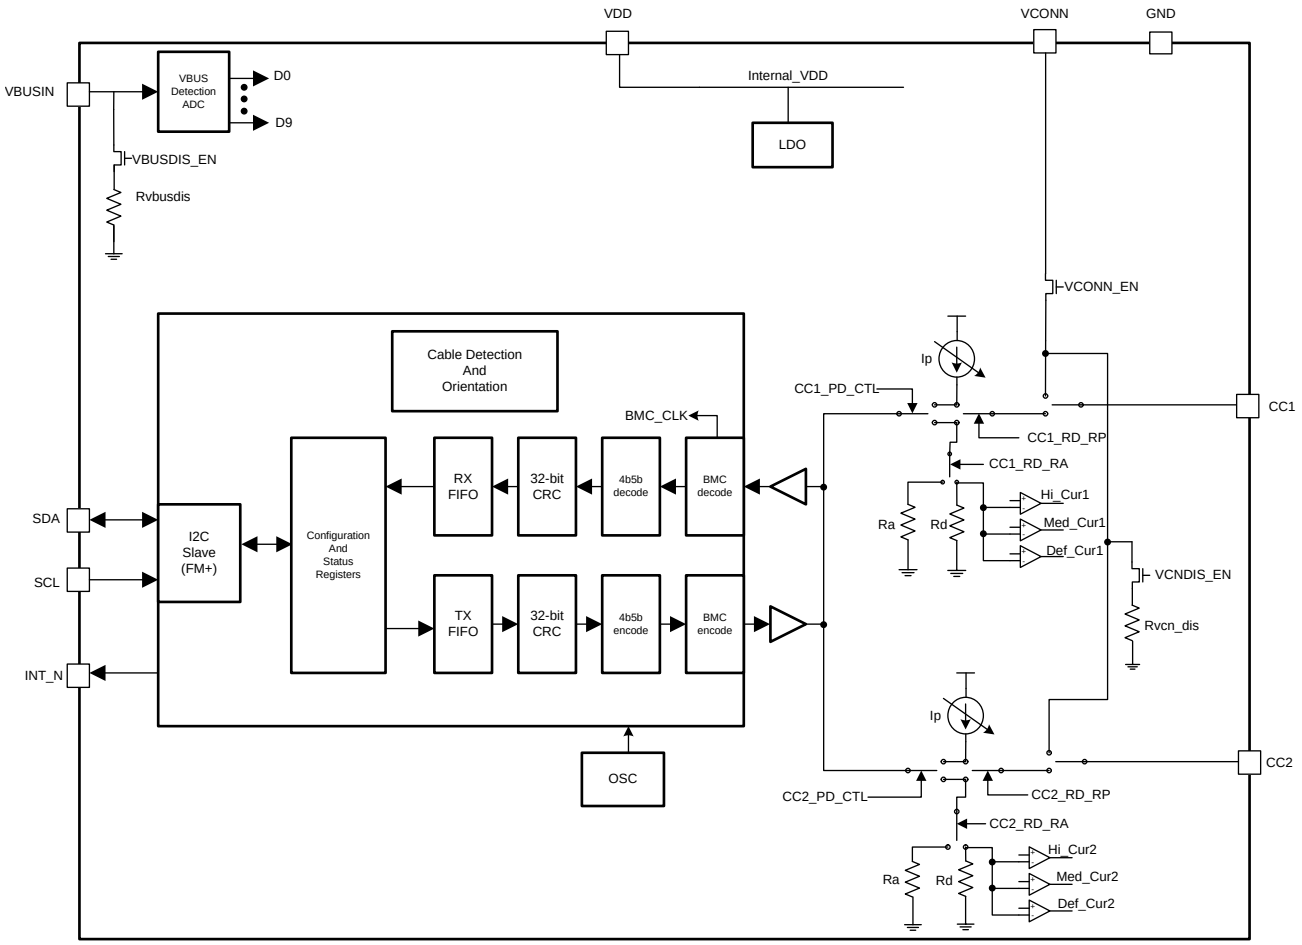
7 Detailed Description

7.1 Overview

The USB Type-C ecosystem operates around a small form factor connector and cable that is flippable and reversible. Due to the nature of the connector, a scheme is needed to determine the connector orientation. Additional schemes are needed to determine when a USB port is attached, determine the acting role of the USB port (Source, Sink, active cable, audio accessory, debug accessory), and communicate Type-C current capabilities. These schemes are implemented over the CC pins according to the *USB Type-C Specification 1.2*. The TUSB422 provides Configuration Channel (CC) logic for determining USB port attach and detach, role detection, cable orientation, and Type-C Current detection/advertisement. The TUSB422 also contains several features such as VCONN sourcing, VBUS enable, VBUS discharge enable, detection of vSafe0V, and low standby current.

The TUSB422 provides a USB Type-C Port Controller Interface (TCPCi) allowing the USB Type-C Port Manager (TCPM) residing in an external microprocessor the ability to determine when a port partner is attached or removed, cable orientation, enable or remove power to the Type-C port. The TUSB422 implements a USB PD BMC physical layer and protocol layer for communication over the Type-C port for purposes like power negotiations, alternate mode enablement (ie DisplayPort over Type-C), and data role negotiations just to mention a few. The TUSB422 takes a message provided by external processor, calculate and append a 32-bit CRC, encode, and transmit the encoded message over the CC wire in the cable. The TUSB422 also receives data from the CC wire and determined if packet is valid or not, respond with GoodCRC, and notify external processor of its arrival by asserting the interrupt (INT_N).

7.2 Functional Block Diagram



Functional Block Diagram (continued)

7.2.1 Cables, Adapters, and Direct Connect Devices

Type-C Specification 1.2 defines several cables, plugs and receptacles to be used to attach ports. TUSB422 supports all cables, receptacles, and plugs.

7.2.1.1 USB Type-C receptacles and Plugs

- USB Type-C receptacle for USB2.0 and USB3.1 and full-featured platforms and devices
- USB Full-Featured Type-C plug
- USB2.0 Type-C Plug

7.2.1.2 USB Type-C Cables

- USB Full-featured Type-C cable with USB3.1 full featured plug
- USB2.0 Type-C cable with USB2.0 plug
- Captive cable with either a USB Full featured plug or USB2.0 plug

7.2.1.3 Direct Connect Devices

TUSB422 supports the attaching and detaching of a direct connect device such as a cradle dock or captive cable.

7.3 Feature Description

7.3.1 USB PD I2C Type-C Port Controller Interface (TCPC)

The TUSB422 provides up to 1Mbps I2C USB Type-C Port Controller Interface (TCPC) interface and register set allowing for control by external processor. The TUSB422 implements the following optional TCPC features.

- Up to 24 V VBUS Measurement and Alarms
- Default, 1.5 A, and 3 A Source Resistor (Rp) advertisement
- Source VCONN
- VCONN overcurrent fault detection

7.3.2 USB PD BMC PHY

The TUSB422 contains a USB Power Delivery BMC (Bi-phase Mark coded) Baseband phy. The TCPM can enable the TUSB422's USB PD BMC phy for any of the following conditions when the TUSB422 is in Attached.SNK, Attach.SRC, DebugAccessory, or PoweredAccessory state:

- *Receiver Detect Register* is non-zero

The USB PD phy will always be disabled when the TUSB422 is in the unattached mode.

The TUSB422 PD BMC phy receiver threshold will be set based on the value of the POWER_ROLE field in the *Message Header Info* register. The default receiver threshold can be changed by setting the VIX_PD and VIX_PD_OVERRIDE fields in the *PHY BMC RX Control* register.

Table 1. Power Role

POWER-ROLE	V_{IH}	V_{IL}
0	$V_{IH(PD\_SRC)}$	$V_{IL(PD\_SRC)}$
1	$V_{IH(PD\_SNK)}$	$V_{IL(PD\_SNK)}$

7.3.3 DFP (Downstream Facing Port)

The TUSB422 can be used in applications in which USB devices are connected too. For example, in a desktop application the Type-C port(s) must be able to determine when a device is attached and enable both power (in the form of VBUS) and datapath (either USB data and/or Alternate Mode data like DisplayPort) to attached device. The TUSB422 can be used in a DFP application by programming the *Role Control* register to 0x05. This presents Rp on both of TUSB422 CC pins. When configured as a DFP, the TUSB422 can be used to control the sourcing of VCONN. Control of VBUS source path must be handled outside of the TUSB422.

Upon enabling TUSB422 for DFP, the TUSB422 will continuously monitor both CC1 and CC2 for a connection. After a connection has been determined, the TUSB422 will notify system of event by asserting the INT_N pin low. Upon detecting assertion of INT_N, the external microprocessor should read and clear the appropriate *Alert* registers.

The following steps are for initialization of the TUSB422 for DFP operation.

1. Upon TUSB422 power-up, the Power Status flag in *Alert* Register should get set indicating TUSB422 is initialized. When set, this flag will cause the INT_N pin to be assert low.
2. SW read the Alert Registers to determine reason for INT_N assertion. The expectation is Power Status bit (Reg10h bit 1) is set.
3. SW read Power Status register and notice that TCPC_INIT_STATUS flag is cleared. This indicates TUSB422 is ready.
4. SW clear Power Status bit in Alert register by writing a 1'b1 to the bit.
5. Program the TUSB422 to present Rp on both CC pins. This is done by writing 0x05 to the *Role Control* register. If advertising greater than default Type-C current is desired, then write 0x15 for 1.5 A current or 0x25 for 3 A current advertisement
6. Write Look4Connection command to the *Command* register.
7. The TUSB422 now presents Rp on both CC pins and look for a connection.

NOTE

Because TUSB422 supports Dead Battery Mode, a dedicated DFP application (like a Car Charger) which uses the TUSB422 should incorporate a diode in the source power path circuitry to block VBUS from being received by another attached DFP/DRP that is providing VBUS.

7.3.4 UFP (Upstream Facing Port)

A UFP is a port that will present Rd on its CC pins and sink VBUS. The TUSB422 functions as a UFP by programming the *Role Control* register to 0x0A. This will cause TUSB422 to present a Rd on both CC pins.

The following steps are for initialization of the TUSB422 for DFP operation.

1. Upon TUSB422 power-up, the Power Status flag in *Alert* Register should get set indicating TUSB422 is initialized. When set, this flag will cause the INT_N pin to be assert low.
2. SW read the Alert Registers to determine reason for INT_N assertion. The expectation is Power Status bit (Reg10h bit 1) is set.
3. SW read Power Status register and notice that TCPC_INIT_STATUS flag is cleared. This indicates TUSB422 is ready.
4. SW clear Power Status bit in *Alert* register by writing a 1'b1 to the bit.
5. Program the TUSB422 to present Rd on both CC pins. This is done by writing 0x0A to the *Role Control* register
6. Write Look4Connection command to the Command register.
7. The TUSB422 now presents Rd on both CC pins and look for a connection.

7.3.5 DRP (Dual-Role Port)

A Dual-Role port functions as both a DFP and a UFP. The TUSB422 supports DRP either autonomously or manually. In autonomous DRP mode, the TUSB422 state machine toggles between UFP (Rd) and DFP (Rp) on both its CC pins. Autonomous DRP is enabled by programming *Role Control* register to 0x4A and writing Looking4Connection command to the *Command* register. Manual mode is under complete control of external processor. External processor must toggle between writing 0x0A and 0x05 to *Role Control* register at interval defined by Type-C specification summarized in Table 2.

Table 2. USB Type-C DRP Toggle Requirements

PARAMETER	MIN	MAX	DESCRIPTION
t_{DRP}	50 ms	100 ms	The period a DRP shall complete a Source (Rp) to Sink (Rd) and back advertisement

Table 2. USB Type-C DRP Toggle Requirements (continued)

PARAMETER	MIN	MAX	DESCRIPTION
dcSRC.DRP	30%	70%	The percent of time that DRP shall advertise Source (Rp) during t_{DRP} .

The following steps are for initialization of the TUSB422 for DRP operation.

1. Upon TUSB422 power-up, the Power Status flag in *Alert* Register should get set indicating TUSB422 is initialized. When set, this flag will cause the INT_N pin to be assert low.
2. SW read the *Alert* Registers to determine reason for INT_N assertion. The expectation is Power Status bit (Reg10h bit 1) is set.
3. SW read Power Status register and notice that TCPC_INIT_STATUS flag is cleared. This indicates TUSB422 is ready.
4. SW clear Power Status bit in *Alert* register by writing a 1'b1 to the bit.
5. Program the TUSB422 to present Rd on both CC pins. This is done by writing 0x4A to the *Role Control* register
6. Write Look4Connection command to the Command register.
7. The TUSB422 now presents Rd on both Rp pins and look for a connection.

The TUSB422 autonomously toggles between Rd and Rp according to the setting of the *CC General Control* register. If a value other than default value is desired, then CC General control should be programmed to desired value before performing Step 6.

7.3.6 Type-C Current Mode Advertising

Once a valid cable detection and attach have been completed, the TUSB422 has the option to advertise thru CC1/CC2 pins the level of Type-C current a UFP can sink. The TUSB422 supports all three possible Type-C current options: Default (500 mA / 900 mA), Medium(1.5 A), and High (3 A). The current advertisement used by TUSB422 is determined by the value programmed in the *Role Control* register.

NOTE

V_{DD} must be greater than 3.0 V to advertise 3 A current.

7.3.7 VBUS Source Enable/Disable Control

The TUSB422 is unable to directly control VBUS enable due to no GPIO support. For this reason, external microprocessor must directly control the Vbus enable. If it wishes, the external microprocessor may notify the TUSB422 when Vbus has been enable/disabled, or raised above vSafe5V value. Notification to TUSB422 comes in the form of writing to the *Command* register any of the following commands: SourceVbusDefaultVoltage (that is, vSafe5V enable), SourceVbusHighVoltage (that is, greater than vSafe5V), or DisableSourceVbus. If these commands are issued to the TUSB422, the TUSB422 ignores these commands.

7.3.8 VBUS Sink Enable/Disable Control

The TUSB422 cannot directly control VBUS Sink path, and therefore; VBUS sink path control is handled externally. Software may write the SinkVbus command to TUSB422 *Command* register, but the TUSB422 ignores this command.

7.3.9 VBUS Monitoring

One of the features of USB PD is the ability to raise VBUS above the default vSafe5V level. The ability to monitor the VBUS voltage level is critical to determining when VBUS is at desired level as well as when VBUS is no longer present. The TUSB422 implements measuring of VBUS and the results are stored in the *VBUS Voltage* register. The VBUS voltage measurement is enabled by setting the VBUS_VOLTAGE_MONITOR bit in the *Power Control* register.

7.3.10 VBUS Discharge

The TUSB422 implements internal VBUS discharge. The TUSB422 can be setup to discharge VBUS automatically based on Type-C conditions or software can force a VBUS discharge by setting the FORCE_DISCHARGE bit in the *Power Control* register.

The TUSB422 cannot directly control the enable of external VBUS switch. Therefore, software must disable VBUS switch before or immediately after discharge of VBUS is required.

The TUSB422 meets the USB PD standard with a bulk capacitance defined by $C_{(BULK\_SRC)}$. If bulk capacitance greater than $C_{(BULK\_SRC)}$ is required, then external VBUS discharge must be used. If an external VBUS discharge is desired, the TUSB422 internal VBUS discharge circuit can be disabled by setting the INT_VBUSDIS_DISABLE bit in the *VBUS and VCONN Control* register.

7.3.11 VBUS to CC Short Detection from Legacy Charger

A legacy Type-A charger will always have VBUS active. When customer plugs a Type-A to Type-C cable into both charger and TUSB422, the TUSB422 immediately detects Rp and then detects VBUS. If for some reason, there is a short between VBUS and CC, the TUSB422 the CC pin is exposed to VBUS voltage. The TUSB422 implements a detection of VBUS to CC short by monitoring voltage level on each the CC pin. If the initial voltage is above 3.5 V and TUSB422 is presenting Rd, then the TUSB422 will set the CC_FAULT status flag. The TUSB422 keeps the CC1_STATE and CC2_STATE flags in the open state. This indicates a invalid connection exist and user should be notified. The TUSB422 continues to look for a valid connection. Once user removes the fault condition (for example, selects a new cable), the TUSB422 indicates a valid connection by updating CC1_STATE and CC2_STATE to appropriate value.

7.3.12 VBUS Power Source Requirements

The TUSB422 is a Source if MESSAGE_HEADER_INFO POWER_ROLE = 1. As outlined in the USB TCPCi specification, the TUSB422 when operating as a source discharges VBUS under any of the following conditions when Auto Discharge (AUTO_DISCHARGE_DISCONNECT = 1) is enabled.

- Disconnect (Removal of Rd by port partner) is detected. The TUSB422 discharges VBUS to vSafe0V.
- Upon setting Force Discharge bit, the TUSB422 discharges VBUS to either vSafe0V or to the voltage specified by *VBUS Stop Discharge* register.

The TUSB422 does not automatically discharge VBUS upon reception of a Hard Reset.

7.3.13 VBUS Power Sink Requirements.

The TUSB422 is a Sink if MESSAGE_HEADER_INFO POWER_ROLE = 0. As outlined in the TCPC specification, the TUSB422 when operating as a sink must discharge VBUS to vSafe0V under any of the following conditions when Auto Discharge (AUTO_DISCHARGE_DISCONNECT = 1) is enabled.

- If VBUS present detection is enabled and *VBUS Sink Disconnect Threshold* register is zero and VBUS present bit in the Power Status register transitions from a 1 to 0.
- VBUS crosses the threshold programmed in the VBUS Sink Disconnect Threshold register.

7.3.14 VCONN

VCONN is required by active cables, emarker, and VCONN powered accessories like Alt Mode adapters. These types of devices or cables present Ra on one CC pin and Rd on the other CC pin. VCONN must be enabled when any of device or cable requiring VCONN is connected to a Type-C port and the TUSB422 is operating as a DFP or DFP in DRP mode. Software can also enable the VCONN switch when the TUSB422 is a UFP during a VCONN_SWAP sequence. The TUSB422 implements a VCONN switch which is controlled by software. The default state of this switch is open. By setting the ENABLE_VCONN bit in *Power Control* register, the TUSB422 removes closes the switch resulting in VCONN power to be connected to the CC pin indicated by value of PLUG_ORIENTATION bit in *TCPC Control* register.

Once the VCONN switch is closed, the switch can be opened by any of the following conditions.

- Software clear ENABLE_VCONN bit in *Power Control* register.
- VCONN overcurrent fault condition occurs resulting in TUSB422 opening VCONN switch and setting the VCONN_OCP_FAULT_STATUS bit in *Fault Status* register.
- Over temperature condition detected by TUSB422. Must be enabled in *OTSD Control* register.
- Hard Reset ordered set is received.
- Cable is removed (Rd no longer present) results in TUSB422 opening VCONN switch and discharging VCONN to vSafe0V

The TUSB422 discharges VCONN to vSafe0V by enabling Rd at designated CC pin anytime the VCONN switch transitions from closed to open state. Once at vSafe0V, the TUSB422 disables the discharge circuit by removing Rd and then re-enable Rp (assuming it is still enabled in *Role Control* register).

If an external VCONN discharge is desired, the TUSB422 internal VCONN discharge circuit can be disabled by setting the INT_VCONNDIS_DISABLE bit in the *VBUS and VCONN Control* register.

Before closing the VCONN switch, the TCPM must make sure the voltage on VCONN pin is at a valid level. When opening the VCONN switch by clearing the ENABLE_VCONN bit, the TCPM software must make sure voltage on VCONN pin is at valid level until after VCONN switch is opened and then, if desired, can remove the voltage from the VCONN pin. Removing the voltage on VCONN pin before Vconn switch is opened will result in a false VCONN fault condition.

7.3.15 Interrupts

The TUSB422 asserts the INT_N pin low anytime an unmasked event occurs. Upon assertion of the interrupt, the TCPM should read the *Alert* Registers to determine the reason for interrupt. Upon reading the *Alert* register, the TCPM should clear the interrupt by writing a 1'b1 to the appropriate field in the Alert register.

If the FAULT flag is set in the *Alert* register, the TCPM must first read the *Fault Status* register to determine reason for fault. Then clear the appropriate field in the *Fault Status* register by writing a 1'b1. Once all fields in *Fault Status* register are cleared, the TCPM can then clear the flag in the *Alert* Register by writing a 1'b1.

The TUSB422 also has Vendor Defined Interrupt registers which is not part of the USB TCPC specification. These vendor defined interrupts are masked by default. Software can enable vendor interrupts by setting the appropriate bit in the Vendor Interrupts Mask Register and setting the VENDOR_IRQ_MASK field in the Alert Mask register.

7.3.16 Fast Role Swap

The TUSB422 supports Fast Role Swap as defined in the USB Power Delivery 3.0 specification. Fast Role swap detection is disabled by default but can be enabled by setting the FASTROLE_RX_EN bit in the PHY BMC RX Control Register. After FastRole swap detection is enabled, the TUSB422 monitors PD communication for a pulse duration that meets the $T_{FRSWAPRX}$ requirement. If FastRole swap is detected, the TUSB422 sets the FAST_ROLE_SWAP_STAT bit in the Vendor Interrupts Status register. Assuming Vendor defined interrupts are enabled, the TCPM will notice the Fast Role swap by the assertion of INT_N pin. If the TUSB422 was in the process of transmitting over PD when Fast Role Swap is detected, the TUSB422 sets either the TX_SOP_DISCARD or TX_SOP_FAIL alert flag. The TCPM must perform the necessary steps as defined by the USB PD 3.0 specification once it is notified of the Fast Role Swap event.

The TUSB422 can also transmit a FastRole swap pulse. This is done by writing a 1'b1 to the TX_FAST_ROLE_SWAP bit in the PHY BMC TX Control register. Upon setting this bit, the TUSB422 generates a FastRole swap pulse as defined by $T_{FRSWAPTX}$ parameter. The TUSB422 clears the TX_FAST_ROLE_SWAP bit after it has completed the transmission.

7.4 Device Functional Modes

7.4.1 Unattached Mode

Unattached mode is the primary mode of operation for the TUSB422 since a USB port can be unattached for a lengthy period of time. In this mode, the TUSB422 may be configured as UFP (present Rd on both CC pins), DFP (present Rp on both CC pins), or DRP (alternate between Rp and Rd on both CC pins) operation and waiting for a connection. The TUSB422 remains in this mode until a connection is detected. Upon detection of a connection, the INT_N pin will be asserted low.

In Unattached mode, VDD is available, and all IOs are operational. VCONN is disabled. USB PD BMC phy is disabled.

Device Functional Modes (continued)

7.4.2 Active Mode

The TUSB422 is in the Active mode when either CC1_STATE field or CC2_STATE field in the *CC Status* register are non-zero, the TCPM has completed the required Type-C debounce of CC pins, and the TCPM has set the AUTO_DISCHARGE_DISCONNECT in the *Power Control* register. In active mode, all IOs are operational, and VCONN is available for an active cable. The USB PD phy can be enabled in this mode by setting the *Receiver Detect Register* to a non-zero value. The USB PD BMC PHY functionality can only be used if the TUSB422 is in any of the following active states: Attached.SRC, Attached.SNK, DebugAccessory, or PoweredAccessory. Use of TUSB422 USB PD BMC PHY in any other active state is not permitted.

7.4.3 Power Role Swap

Upon entering the active mode, the power provider and consumer is determined by whether or not TUSB422 is presenting a Rp or a Rd on CC pins. If TUSB422 is presenting a Rp, then TUSB422 is a power provider. If TUSB422 is presenting a Rd, then TUSB422 is a power consumer. Once in the active mode, it may become necessary change power role through performing a power role swap. Key requirements for performing a power role swap by the software are listed below. For additional details on power role swap, consult the USB PD specification.

Transition from power provider to power consumer:

1. TCPM state machine needs to transition from Attached.SRC to Attached.SNK.
2. Disable VBUS source. TCPM should send DisableSourceVbus command to TUSB422 *Command* register.
3. Once VBUS is at vSafe0V, change *Role Control* register to present a Rd.
4. Upon reception of PS_RDY message from port partner, update message header information and send PS_RDY back to port partner.
5. Enable Sink VBUS and VBUS presence detection. TCPM should send SinkVbus and EnableVbusDetect commands to TUSB422 *Command* register.

Transition from power consumer to power provider:

1. Disable AUTO_DISCHARGE_DISCONNECT in the *Power Control* register
2. Disable VBUS presence detection. TCPM should send DisableVbusDetect command to TUSB422 *Command* register.
3. Disable system sink VBUS. TCPM should also send DisableSinkVbus command to TUSB422 *Command* register.
4. TCPM state machine needs to transition from Attached.SNK to Attached.SRC.
5. Upon reception of PS_RDY message from port partner, change *Role Control* register to present a Rp.
6. Enable system source VBUS. TCPM should send SourceVbusDefaultVoltage command to TUSB422 *Command* register.
7. Once VBUS is at vSafe5V, the TCPM should then send PS_RDY to its port partner.
8. Upon successful completion of power-role swap, enable AUTO_DISCHARGE_DISCONNECT in the *Power Control* register

7.4.4 Debug Accessory

A Debug accessory is a device which presents Rd on both of TUSB422 CC pins or Rp on both of TUSB422 CC pins. The TUSB422 upon detecting either of these two conditions on its CC pins performs the required Type-C debounce. If either condition is still present at end of the debounce, the TUSB422 sets the DEBUG_ACC_CONNECTED bit in the Power Status Register.

The TCPM is required to determine cable orientation by reading the CC1_STATE and CC2_STATE in the *CC Status* register and writing the orientation to the PLUG_ORIENTATION bit in the *TCPC Control* register.

Table 3. DebugAccessory Attached as a Sink

CC1_STATE	CC2_STATE	TCPM Writes to PLUG_ORIENTATION bit
2'b10 (Rd)	2'b01 (Ra)	1'b0. PD communication over CC1
2'b01 (Ra)	2'b10 (Rd)	1'b1. PD communication over CC2

Table 4. DebugAccessory Attached as a Source

CC1_STATE	CC2_STATE	TCPM Writes to PLUG_ORIENTATION bit
Voltage is greater than CC2_STATE.	Voltage is less than CC1_STATE.	1'b0. PD communication over CC1
Voltage is less than CC2_STATE	Voltage is greater than CC1_STATE.	1'b1. PD communication over CC2

7.4.5 Dead Battery Mode

Low battery power could cause conditions in which communication over USB Type-C can no longer be maintained. When this situation occurs, it is critical to transition to attached.SNK state so that power from VBUS can be used to charge the battery back to an operational level. This condition is known as Dead Battery Mode. The TUSB422 supports dead-battery mode by presenting Rd to both CC pins when V_{DD} is no longer active.

In the dead-battery mode access to TUSB422 registers is not available. Upon exiting dead-battery mode, the TUSB422 enters mode dictated by the value of *Role Control* register.

7.5 Programming

The TUSB422 is controlled using I2C. The TUSB422 local I2C interface is available for reading/writing after $T_{INT\_N\_LOW}$ after the device is powered up. The SCL and SDA terminals are used for I2C clock and I2C data respectively.

Figure 5. TUSB422 I2C Addresses

7 (MSB)	6	5	4	3	2	1	0 (W/R)
0	1	0	0	0	0	0	0/1

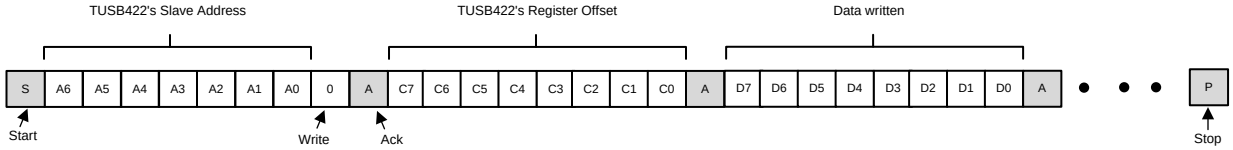


Figure 6. I2C Write With Data

The following procedure should be followed to write data to TUSB422 I^2C registers (refer to Figure 6):

1. The master initiates a write operation by generating a start condition (S), followed by the TUSB422 7-bit address and a zero-value "W/R" bit to indicate a write cycle.
2. The TUSB422 acknowledges the address cycle.
3. The master presents the sub-address (I^2C register within TUSB422) to be written, consisting of one byte of data, MSB-first.
4. The TUSB422 acknowledges the sub-address cycle.
5. The master presents the first byte of data to be written to the I^2C register.
6. The TUSB422 acknowledges the byte transfer
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the TUSB422.
8. The master terminates the write operation by generating a stop condition (P).

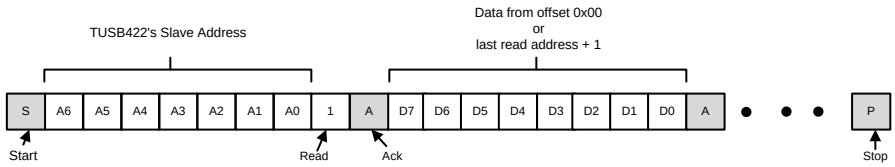

Figure 7. I2C Read Without Repeated Start

The following procedure should be followed to read the TUSB422 I²C registers without a repeated Start (refer Figure 7).

1. The master initiates a read operation by generating a start condition (S), followed by the TUSB422 7-bit address and a zero-value "W/R" bit to indicate a read cycle.
2. The TUSB422 acknowledges the 7-bit address cycle.
3. Following the acknowledge the master continues sending clock.
4. The TUSB422 transmit the contents of the memory registers MSB-first starting at register 00h or last read sub-address+1. If a write to the I²C register occurred prior to the read, then the TUSB422 shall start at the sub-address specified in the write.
5. The TUSB422 waits for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I²C master acknowledges reception of each data byte transfer.
6. If an ACK is received, the TUSB422 transmits the next byte of data as long as master provides the clock. If a NAK is received, the TUSB422 stops providing data and waits for a stop condition (P).
7. The master terminates the write operation by generating a stop condition (P).

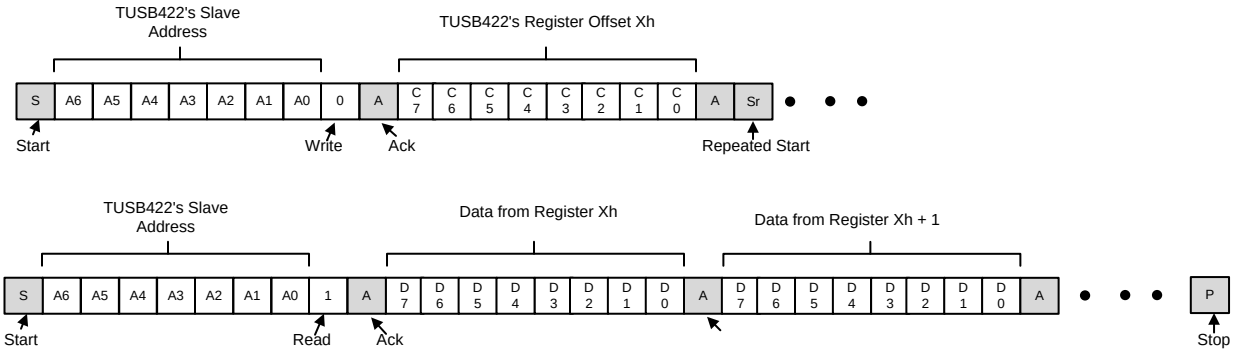

Figure 8. I2C Read With Repeated Start

The following procedure should be followed to read the TUSB422 I²C registers with a repeated Start (refer Figure 8).

1. The master initiates a read operation by generating a start condition (S), followed by the TUSB422 7-bit address and a zero-value "W/R" bit to indicate a write cycle.
2. The TUSB422 acknowledges the 7-bit address cycle.
3. The master presents the sub-address (I²C register within TUSB422) to be written, consisting of one byte of data, MSB-first.
4. The TUSB422 acknowledges the sub-address cycle.
5. The master presents a repeated start condition (Sr).
6. The master initiates a read operation by generating a start condition (S), followed by the TUSB422 7-bit address and a one-value "W/R" bit to indicate a read cycle.
7. The TUSB422 acknowledges the 7-bit address cycle.
8. The TUSB422 transmit the contents of the memory registers MSB-first starting at the sub-address.
9. The TUSB422 shall wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I²C master acknowledges reception of each data byte transfer.
10. If an ACK is received, the TUSB422 transmits the next byte of data as long as master provides the clock. If a NAK is received, the TUSB422 stops providing data and waits for a stop condition (P).
11. The master terminates the read operation by generating a stop condition (P).

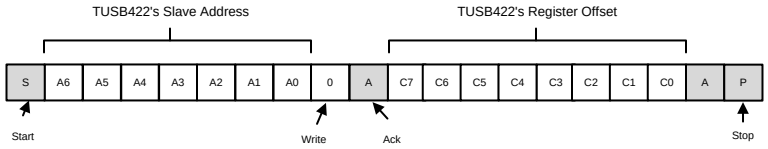

Figure 9. I2C Write Without Data

The following procedure should be followed for setting a starting sub-address for I^2C reads (refer to Figure 8).

1. The master initiates a write operation by generating a start condition (S), followed by the TUSB422 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The TUSB422 acknowledges the address cycle.
3. The master presents the sub-address (I^2C register within TUSB422) to be written, consisting of one byte of data, MSB-first.
4. The TUSB422 acknowledges the sub-address cycle.
5. The master terminates the write operation by generating a stop condition (P).

After initial power-up, if no sub-addressing is included for the read procedure (refer to Figure 8), then reads start at register offset 00h and continue byte by byte through the registers until the I^2C master terminates the read operation. During a read operation, the TUSB422 auto-increments the I^2C internal register address of the last byte transferred independent of whether or not an ACK was received from the I2C master.

7.6.1 CSR Registers

Table 6. Register Definitions

ACCESS TAG	NAME	DESCRIPTION
R	Read	The field may be read by software
W	Write	The field may be written by software
S	Set	The field may be set by a write of one. Writes of zeros to the field have no effect.
C	Clear	The field may be cleared by a write of one. Write of zero to the field have no effect.
A	Clear after Read	The field will be cleared by hardware upon software reading from the field
U	Update	Hardware may autonomously update this field.
NA	No Access	Not accessible or not applicable

Unless otherwise noted, all undefined or reserved registers are read-only and return zeros when read. Also unless otherwise noted, writes to undefined or reserved registers will be acknowledged but data will be discarded.

7.6.2 Vendor ID Byte 0 Register (address = 0x00) [reset = 0x51]

7.6.14 Alert Byte 0 Register (address = 0x10) [reset = 0x00]

This register is used to indicate a status change event. When a status change event occurs and its corresponding Alert mask is unmasked, the TUSB422 will assert the INT_N low. The INT_N remains asserted until all events are cleared by write of 1'b1. Once all events are cleared or corresponding Alert mask is masked, the INT_N will be de-asserted high.

Table 19. Alert Byte 0 Register Descriptions

Bit	Field	Type	Reset	Description
7	VBUS_ALARM_HI	RCU	0	VBUS Voltage Alarm Hi. 0b: Cleared 1b: A high-voltage alarm has occurred
6	TX_SOP_SUCCESS	RCU	0	Transmit SOP* Message Successful 0b: Cleared 1b: Reset or SOP* message transmission successful. GoodCRC response received on SOP* message transmission. Transmit SOP* message buffer registers are empty.
5	TX_SOP_DISCARD	RCU	0	Transmit SOP* Message Discarded 0b: Cleared 1b: Reset or SOP* message transmission not sent due to incoming receive message. Transmit SOP* message buffer registers are empty.
4	TX_SOP_FAIL	RCU	0	Transmit SOP* Message Failed 0b: Cleared 1b: SOP* message transmission not successful, no GoodCRC response received on SOP* message transmission. Transmit SOP* message buffer registers are empty.
3	RX_HARD_RESET	RCU	0	Received Hard Reset. 0b: Cleared. 1b: Received Hard Reset message
2	RX_SOP_STATUS	RCU	0	Receive SOP* Message Status. Note RECEIVE_BYTE_COUNT being zero does not set this bit. 0b: Cleared. 1b: Receive buffer register changed.
1	PWR_STATUS	RCU	0	Power Status 0b: Cleared. 1b: Power Status Changed
0	CC_STATUS	RCU	0	CC Status. 0b: Cleared 1b: CC status changed

7.6.15 Alert Byte 1 Register (address = 0x11) [reset = 0x00]

This register is used to indicate a status change event. When a status change event occurs and its corresponding Alert mask is unmasked, the TUSB422 will assert the INT_N low. The INT_N remains asserted until all events are cleared by write of 1'b1. Once all events are cleared or corresponding Alert mask is masked, the INT_N will be de-asserted high.

Table 20. Alert Byte 1 Register Descriptions

Bit	Field	Type	Reset	Description
7	VENDOR_IRQ_STAT	RCU	0	This field is set if a Vendor defined interrupt that is unmasked is set. TCPM SW should first clear the appropriate bit in Vendor Interrupt Status register before clearing this field. 0b: Vendor IRQ not asserted. 1b: Vendor IRQ asserted.
6:4	Reserved	R	0x0	Reserved
3	VBUS_SINK_DIS	RCU	0	VBUS Sink Disconnect Detected. 0b: Cleared 1b: A VBUS Sink Disconnect Threshold crossing has been detected
2	RRX_BUF_OVR	RCU	0	Rx Buffer Overflow 0b: TUSB422 Rx buffer is functioning properly 1b: TUSB422 Rx buffer has overflowed Writing 1 to this register acknowledges the overflow. The overflow is cleared by writing to ALERT.ReceiveSOP*MessageStatus
1	FAULT	RCU	0	Fault 0b: No Fault 1b: A Fault has occurred. Read the FAULT_STATUS register
0	VBUS_ALARM_LO	RCU	0	VBUS Voltage Alarm Lo 0b: Cleared 1b: A low-voltage alarm has occurred

7.6.16 Alert Mask Byte 0 Register (address = 0x12) [reset = 0xFFh]

This register controls whether or not a status change event in Alert register will cause the INT_N to be asserted low. When a specific event is masked, its corresponding status change event will not cause INT_N to be asserted low.

Figure 24. Alert Mask Byte 0 Register

7	Reserved	R	0	Shall be set to zero by sender and ignored by receiver
6	FORCEOFF_VBUS_STATUS	RCU	0	0b: No Fault Detected, no action (default and not supported) 1b: VBUS Source/Sink has been forced off due to external fault The TUSB422 has disconnected VBUS due to STANDARD_INPUT.ForceOffVbus. This field has no meaning for TUSB422
5	AUTO_DIS_FAIL_STATUS	RCU	0	0b: No discharge failure 1b: Discharge commanded by the TCPM failed If POWER_CONTROL.AutoDischargeDisconnect is set, the TUSB422 will report discharge fails if VBUS is not below vSafe0V within tSafe0V.
4	FORCE_DIS_FAIL_STATUS	RCU	0	0b: No discharge failure 1b: Discharge commanded by the TCPM failed If POWER_CONTROL.ForceDischarge is set, the TUSB422 will report a discharge fails if VBUS is not below vSafe0V within tSafe0V.
3	VBUS_OCP_FAULT_STATUS	RCU	0	0b: Not in an over-current protection state 1b: Over-current fault latched This field has no meaning for TUSB422
2	VBUS_OVP_FAULT_STATUS	RCU	0	0b: Not in an over-voltage protection state 1b: Over-voltage fault latched. This field has no meaning for TUSB422
1	VCONN_OCP_FAULT_STATUS	RCU	0	The TUSB422 will set this flag if an VCONN over current fault is detected. This flag will also get set if voltage on VCONN pin drops between VCONN present threshold while the Vconn switch is still closed. 0b: No Fault detected 1b: Over current VCONN fault latched
0	I2C_INT_ERROR_STATUS	RCU	0	0b: No Error 1b: I2C error has occurred. A TRANSMIT has been sent with an empty TRANSMIT_BUFFER.

7.6.28 Command Register (address = 0x23) [reset = 0x00]

Figure 36. Command Register

7	6	5	4	3	2	1	0
COMMAND							
RWU							

LEGEND: R/W = Read/Write; R = Read only

Table 33. Command Register Descriptions

Bit	Field	Type	Reset	Description
7	COMMAND	RWU	0x00	0001 0001b WakeI2C. The TUSB422 will accept this command but will do nothing with it.
				0010 0010b DisableVbusDetect. Disable Vbus present detection. v
				0011 0011b EnableVbusDetect. Enable Vbus present detection.
				0100 0100b DisableSinkVbus. The TUSB422 clears SINKING_VBUS bit in Power Status register
				0101 0101b SinkVbus. If SNK_VBUS_SUPPORT bit is set, then TUSB422 will set SINKING_VBUS bit in Power Status register and enable VBUS present detection.
				0110 0110b DisableSourceVbus. The TUSB422 will clear SOURCING_VBUS and SOURCING_HIGH_VOLTAGE bits in Power Status register.
				0111 0111b SourceVbusDefaultVoltage. If SRC_VBUS_SUPPORT is set, the TUSB422 will set SOURCING_VBUS in Power Status register and will also enable VBUS present detection.
				1000 1000b SourceVbusHighVoltage. If SRC_VBUS_HIGH_SUPPORT is set, then TUSB422 will set SOURCING_HIGH_VOLTAGE in Power Status register.
				1001 1001b Look4Connection. Start DRP Toggling if ROLE_CONTROL.DRP=1b. If ROLE_CONTROL.CC1/CC2 = 01b start with Rp, if ROLE_CONTROL.CC1/CC2 =10b start with Rd. If ROLE_CONTROL.CC1/CC2 are not both 01b or 10b, then do not start toggling. The TCPM shall issue COMMAND.Look4Connection to enable the TUSB422 to restart Connection Detection in cases where the ROLE_CONTROL contents will not change. An example of this is when a potential connection as a Source occurred but was further debounced by the TCPM to find the Sink disconnected. In this case a Source Only or DRP should go back to its Unattached.Src state. This would result in ROLE_CONTROL staying the same. TUSB422 to MAINTAIN_STATE
				1010 1010b RxOneMore. Configure the receiver to automatically clear the RECEIVE_DETECT register after sending the next GoodCRC. This is used to shutdown reception of packets at a known point regardless of packet separation or the depth of the receive FIFO in the TUSB422.
				1100 1100b: Reserved. No Action
				1101 1101b: Reserved. No Action
				1110 1110b: Reserved. No Action
				1111 1111b I2C Idle. The TUSB422 will accept this command but will do nothing with it.

7.6.37 Receive Byte Count Register (address = 0x30) [reset = 0x00]

The TUSB422 clears this field to 0x00 upon reception or transmission of a Hard Reset ordered set or after a disconnection is detected. The TUSB422 will also clear this field to 0x00 after the RX_SOP_STATUS bit in Alert register is cleared. Software will use this register to determine the numbers of bytes in the Receiver Buffer Data object.

7.6.51 VBUS Stop Discharge Threshold Byte 0 Register (address = 0x74) [reset = 0x00]

When VBUS Stop Discharge Threshold register is programmed to a non-zero value and TUSB422 is a VBUS Source, the TUSB422 will discharge to value programmed into this register. If this register is programmed to all zeros, then TUSB422 will discharge to vSafe0V. If Software requires discharge to voltage other than vSafe0V, then software must program this register to desired voltage. When TUSB422 is a VBUS Sink and a detach occurs, discharge will always stop at vSafe0V.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

Figure 76 is for the TUSB422 in WLCSP package configured in DRP mode.

8.2 Typical Application

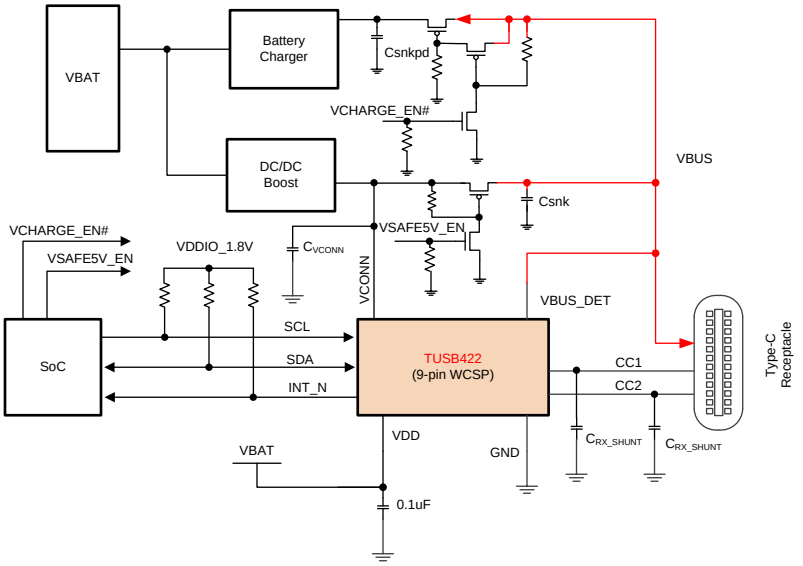

Figure 76. TUSB422 in DRP Application

8.2.1 Design Requirements

For this design example, use the parameters shown in Table 73.

Table 73. Design Parameters

PARAMETER	VALUE
V_{DD} supply (2.7 V to 5.5 V)	VBAT
$V_{(CC1/CC2)}$, Minimum Voltage on CC1/CC2 when VCONN switch is closed.	3 V
Minimum $V_{(VCONN)}$ power	1 Watt
I^2C Level (1.8 V or 3.3 V)	1.8 V
Max I^2C bus capacitance	150 pF
I^2C Speed (400 KHz or 1 MHz).	400 KHz
External pull-up resistor on SDA and SCL.	1.5 KΩ
External pull-up resistor on INT_N	200 KΩ
CRX_SHUNT (200 pF to 450 pF)	220 pF
$C_{(VCONN)}$	10 µF

8.2.2 Detailed Design Procedure

The TUSB422 supports a large V_{DD} supply range allowing it to be powered from an external battery (VBAT).

The TUSB422 I^2C slave interface supports up to 1 MHz (Fast Mode+) at either 1.8 V or 3.3 V signal levels. Depending on the signaling level of the I^2C master, the TUSB422 SDA and SCL should be pulled up to either 1.8 V or 3.3 V. For this particular example, the SDA and SCL are pulled up to 1.8 V. The actual pullup resistor value chosen is based maximum I^2C bus capacitance and the maximum I^2C frequency. A 1.5 KΩ resistor was chosen to support a 150 pF maximum I^2C bus capacitance and a 400 KHz I^2C clock.

The INT_N pin is used by the TUSB422 to communicate events to software running on an external CPU. This pin requires an external pull-up resistor to 1.8 V, 3.3 V, or TUSB422 V_{DD} supply. Typically, INT_N is pulled up to the same supply as the SDA and SCL pins. The recommend pull-up value is 200 KΩ.

The USB Type-C specification uses VCONN to power Type-C active cables and cable plugs. The minimum VCONN power mandated by the specification is 1 W. The TUSB422 incorporates an internal switch to route power from VCONN pin to one of the CC pins (CC1 or CC2). A recent ECN for VCONN redefines VCONN voltage range to 3 V — 5.5 V from the originally defined 4.75 V — 5.5 V. Given TUSB422 maximum $R_{ds(on)}$ and the minimum $I_{(VCONN)}$ current, the allowable VCONN power through the TUSB422 is derived by Equation 1.

$$(V_{(VCONN)} - V_{(VCC1/CC2)}) / R_{ds(on)}(max) < I_{(VCONN)}(min) \quad (1)$$

where:

- where $V_{(VCONN)}$ represents voltage on VCONN pin.
- $V_{(VCONN)}$ is voltage on CC pins.
- $R_{ds(on)}$ (max) is VCONN switch maximum ON resistance,
- and $I_{(VCONN)}$ (min) is the minimum VCONN current fault threshold.

For this example, to support the minimum Type-C $V_{(VCONN)}$ requirement (1 Watt at 3 V), the voltage on the VCONN pin must be greater than 3.25 Volts [(0.333 A x 0.75 Ω) + 3 V]. If system designer desires to support the old VCONN requirement of 1 W at 4.75 V, then the voltage on the VCONN pin must be greater than 4.9 volts [(0.21 A x 0.75 Ω) + 4.75 V].

8.2.3 Application Curve

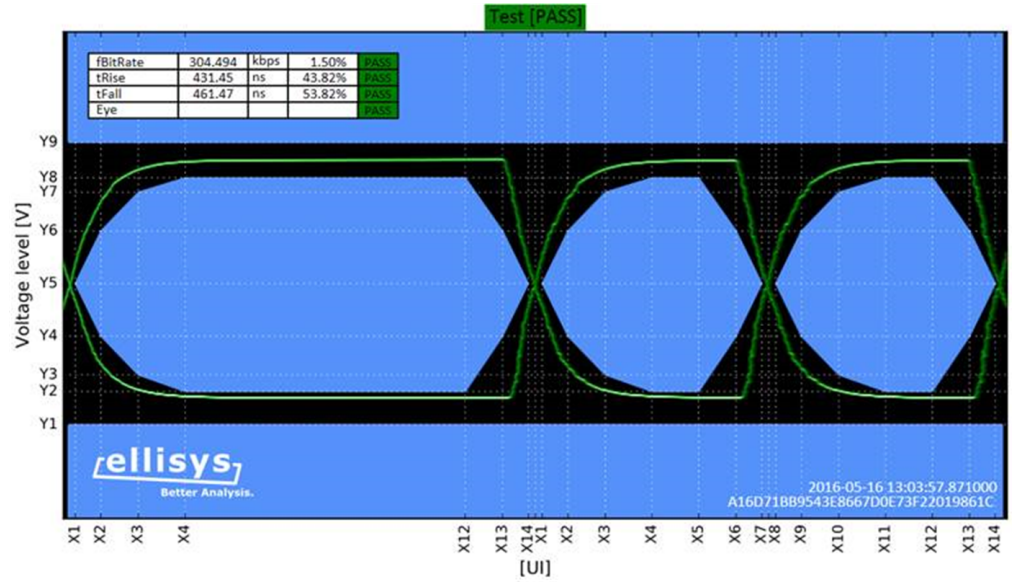

Figure 77. USB PD Tx Eye

9 Power Supply Recommendations

The TUSB422 has a wide power supply range from 2.7 V — 5.5 V.

General Power up Sequence for TUSB422:

- System is powered off (device has no V_{DD}).
- V_{DD} ramps
- TUSB422 asserts INT_N low when initial initialization is complete.
- Software can then start configuring the TUSB422.

10 Layout

10.1 Layout Guidelines

1. Trace width and thickness size for CC1, CC2, and VCONN should be set to meet at least 1 Watt.
2. A 0.1 µF capacitor should be placed as close as possible to TUSB422 V_{DD} pin.

Figure 78 shows via-in-pad for inner pad B2. This is due to the tight placing between two pads. If PCB manufacturing restrictions allows for very small width traces like 2 mils, then via-in-pad is not needed.

10.2 Layout Example

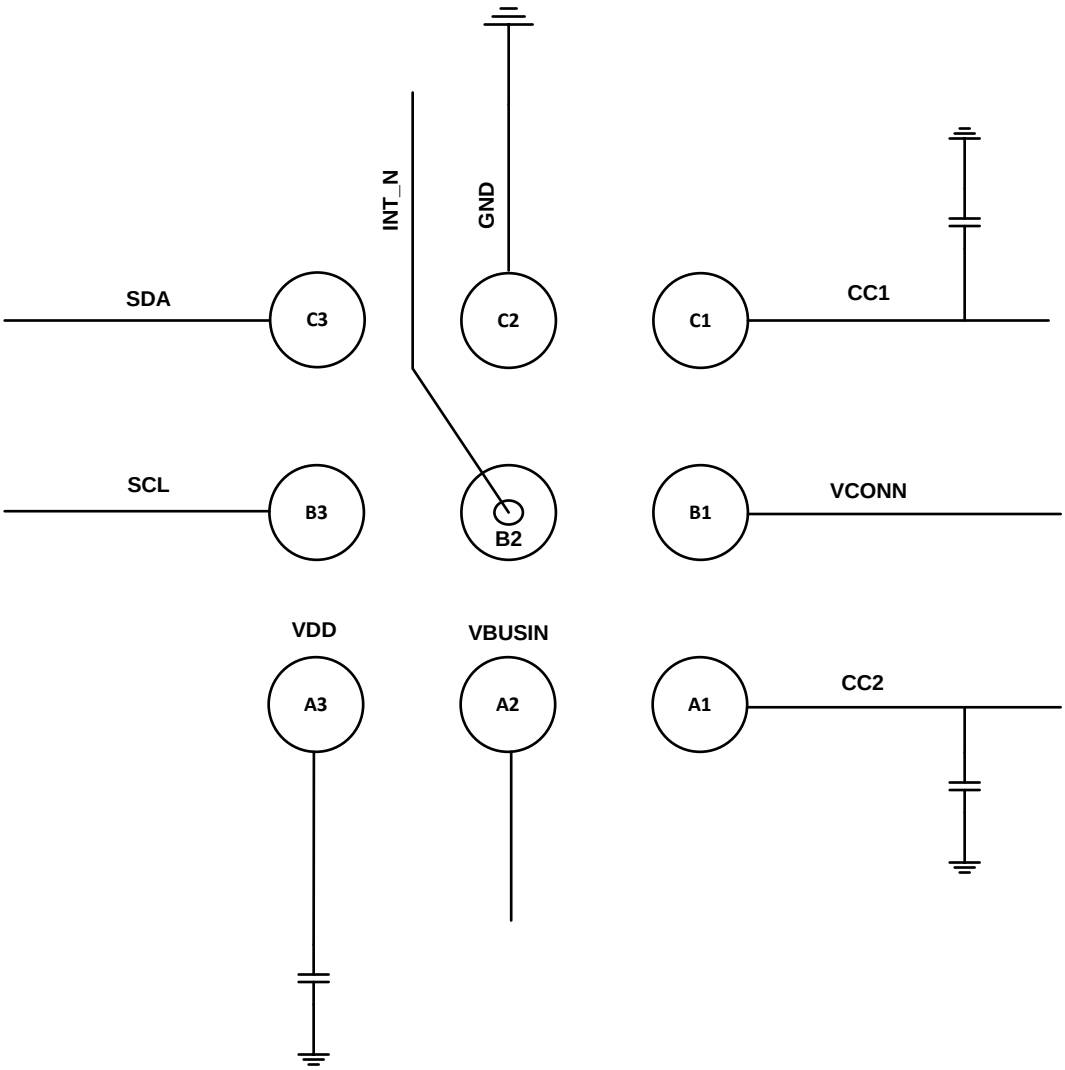

Figure 78. Example Layout

11 Device and Documentation Support

11.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community ***TI's Engineer-to-Engineer (E2E) Community.*** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support ***TI's Design Support*** Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.3 Trademarks

E2E is a trademark of Texas Instruments.
USB Type-C is a trademark of USB Implementers Forum.
All other trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.5 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TUSB422IYFPR	ACTIVE	DSBGA	YFP	9	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	422	Samples
TUSB422IYFPT	ACTIVE	DSBGA	YFP	9	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	422	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
