### 3 Terminal Configuration and Functions

Figure 3-1. QFN 64-Pin Assignments

#### 3.1 Pin Attributes

Table 3-1 describes the CC3100 pins.

#### NOTE

If an external device drives a positive voltage to signal pads when the CC3100 device is not powered, DC current is drawn from the other device. If the drive strength of the external device is adequate, an unintentional wakeup and boot of the CC3100 device can occur. To prevent current draw, TI recommends one of the following:

- All devices interfaced to the CC3100 device must be powered from the same power rail as the CC3100 device.
- Use level-shifters between the CC3100 device and any external devices fed from other independent rails.
- The nRESET pin of the CC3100 device must be held low until the VBAT supply to the device is driven and stable.

$V_{BAT}$ and $V_{IO}$	37, 39, 44	-0.5	3.8	V
$V_{IO}-V_{BAT}$ (differential)	10, 54		0.0	V

RF pins		-0.5	2.1	V
Analog pins (XTAL)		-0.5	2.1	V
Operating temperature range ( $T_A$ )		-40	+85	°C

### 4.2 Handling Ratings

		MIN	MAX	UNIT	
$T_{stg}$	Storage temperature range	-55	+125	°C	
$V_{ESD}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	-2000	+2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	-500	+500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 4.3 Power-On Hours

CONDITIONS	POH
$T_{Ambient}$ up to 85°C, assuming 20% active mode and 80% sleep mode	17,500 <sup>(1)</sup>

(1) The CC3100 device can be operated reliably for 10 years.

### 4.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

PARAMETERS	PINS	CONDITIONS <sup>(2) (3)</sup>	MIN	TYP	MAX	UNIT
$V_{BAT}$ , $V_{IO}$ (shorted to $V_{BAT}$ )	10, 37, 39, 44, 54	Direct battery connection	2.1	3.3	3.6	V
$V_{BAT}$ , $V_{IO}$ (shorted to $V_{BAT}$ )	10, 37, 39, 44, 54	Preregulated 1.85 V	1.76	1.85	1.9	V
Ambient thermal slew			-20		20	°C/minute

(1) Operating temperature is limited by crystal frequency variation.

(2) To ensure WLAN performance, ripple on the 2.1- to 3.3-V supply must be less than  $\pm 300$  mV.

(3) To ensure WLAN performance, ripple on the 1.85-V supply must be less than 2% ( $\pm 40$  mV).

The device enters a brown-out condition whenever the input voltage dips below  $V_{BROWN}$  (see [Figure 4-1](#)). This condition must be considered during design of the power supply routing, especially if operating from a battery. High-current operations (such as a TX packet) cause a dip in the supply voltage, potentially triggering a brown-out. The resistance includes the internal resistance of the battery, contact resistance of the battery holder (4 contacts for a 2 x AA battery) and the wiring and PCB routing resistance.

Note: For V<sub>BAT</sub> wide-voltage mode, V<sub>BROWN</sub> = 2.1 V. For preregulated 1.85-V mode, V<sub>BROWN</sub> = 1.76 V.

**Figure 4-1. Brown-Out Timing Diagram**

For example, the device draws about 400 mA from the supply @ 2.3 V for a 1 DSSS packet at maximum power. This condition can cause a drop of 200 mV across a 0.5-Ω routing resistance.

In the brown-out condition, the device is in RESET state except for the Hibernate module (including the 32-kHz RTC clock), which is kept on. The current in this state can reach approximately 400 μA.

## 4.7 WLAN Transmitter Characteristics

$T_A = +25^\circ\text{C}$ ,  $V_{\text{BAT}} = 2.1$  to  $3.6$  V. Parameters measured at SoC pin on channel 7 (2442 MHz).<sup>(1)</sup>

Parameter	Condition <sup>(2)</sup>	Min	Typ	Max	Units
Maximum RMS output power measured at 1 dB from IEEE spectral mask or EVM	1 DSSS		18.0		dBm
	2 DSSS		18.0		
	11 CCK		18.3		
	6 OFDM		17.3		
	9 OFDM		17.3

(1) Channel-to-channel variation is up to 2 dB. The edge channels (2412 and 2472 MHz) have reduced TX power to meet FCC emission limits.

(2) In preregulated 1.85-V mode, maximum TX power is 0.25 to 0.75 dB lower for modulations higher than 18 OFDM.

### 4.8 Current Consumption

T<sub>A</sub> = +25°C, V<sub>BAT</sub> = 3.6 V

PARAMETER	TEST CONDITIONS <sup>(1) (2)</sup>		MIN	TYP <sup>(3)</sup>	MAX	UNIT
TX	1 DSSS	TX power level = 0		272		mA
		TX power level = 4		188		
	6 OFDM	TX power level = 0		248		
		TX power level = 4		179		
	54 OFDM	TX power level = 0		223		
		TX power level = 4		160		
RX	1 DSSS			53		
	54 OFDM			53		
Idle connected <sup>(4)</sup>				0.69		
LPDS				0.115		
Hibernate				4		µA
Peak calibration current <sup>(5)</sup>	V <sub>BAT</sub> = 3.3 V			450		mA
	V <sub>BAT</sub> = 2.1 V			670		
	V <sub>BAT</sub> = 1.85 V			700		

- (1) TX power level = 0 implies maximum power (see Figure 4-2 through Figure 4-4). TX power level = 4 implies output power backed off approximately 4 dB.
- (2) The CC3100 system is a constant power-source system. The active current numbers scale based on the V<sub>BAT</sub> voltage supplied.
- (3) External serial-flash-current consumption is not included.
- (4) DTIM = 1
- (5) The complete calibration can take up to 17 mJ of energy from the battery over a time of 24 ms . Calibration is performed sparingly, typically when coming out of Hibernate and only if temperature has changed by more than 20°C or the time elapsed from prior calibration is greater than 24 hours.

Note: The area enclosed in the circle represents a significant reduction in current when transitioning from TX power level 3 to 4. In the case of lower range requirements (14 dbm output power), TI recommends using TX power level 4 to reduce the current.

#### 4.10 Timing and Switching Characteristics

##### 4.10.1 Power Supply Sequencing

For proper operation of the CC3100 device, perform the recommended power-up sequencing as follows:

1. Tie  $V_{BAT}$  (pins 37, 39, 44) and  $V_{IO}$  (pins 54 and 10) together on the board.
2. Hold the RESET pin low while the supplies are ramping up. TI recommends using a simple RC circuit (100K || 0.1  $\mu$ F, RC = 10 ms).
3. For an external RTC clock, ensure that the clock is stable before RESET is deasserted (high).

For timing diagrams, see [Section 4.10.2, Reset Timing](#).

**4.10.3 Clock Specifications**

The CC3100 device requires two separate clocks for its operation:

- A slow clock running at 32.768 kHz is used for the RTC.
- A fast clock running at 40 MHz is used by the device for the internal processor and the WLAN subsystem.

The device features internal oscillators that enable the use of cheaper crystals rather than dedicated TCXOs for these clocks. The RTC can also be fed externally to provide reuse of an existing clock on the system and reduce overall cost.

#### 4.10.3.1 Slow Clock Using Internal Oscillator

The RTC crystal connected on the device supplies the free-running slow clock. The accuracy of the slow clock frequency must be 32.768 kHz  $\pm$ 150 ppm. In this mode of operation, the crystal is tied between RTC\_XTAL\_P (pin 51) and RTC\_XTAL\_N (pin 52) with a suitable load capacitance.

Figure 4-8 shows the crystal connections for the slow clock.

**Figure 4-8. RTC Crystal Connections**

#### 4.10.3.2 Slow Clock Using an External Clock

When an RTC clock oscillator is present in the system, the CC3100 device can accept this clock directly as an input. The clock is fed on the RTC\_XTAL\_P line and the RTC\_XTAL\_N line is held to VIO. The clock must be a CMOS-level clock compatible with VIO fed to the device.

Figure 4-9 shows the external RTC clock input connection.

**Figure 4-9. External RTC Clock Input**

#### 4.10.3.3 Fast Clock ( $F_{ref}$ ) Using an External Crystal

The CC3100 device also incorporates an internal crystal oscillator to support a crystal-based fast clock. The XTAL is fed directly between WLAN\_XTAL\_P (pin 23) and WLAN\_XTAL\_N (pin 22) with suitable loading capacitors.

Figure 4-10 shows the crystal connections for the fast clock.

Figure 4-10. Fast Clock Crystal Connections

#### 4.10.3.4 Fast Clock ( $F_{ref}$ ) Using an External Oscillator

The CC3100 device can accept an external TCXO/XO for the 40-MHz clock. In this mode of operation, the clock is connected to WLAN\_XTAL\_P (pin 23). WLAN\_XTAL\_N (pin 22) is connected to GND. The external TCXO/XO can be enabled by TCXO\_EN (pin 21) from the device to optimize the power consumption of the system.

If the TCXO does not have an enable input, an external LDO with an enable function can be used. Using the LDO improves noise on the TCXO power supply.

Figure 4-11 shows the connection.

Figure 4-11. External TCXO Input

## 4.11 External Interfaces

### 4.11.1 SPI Flash Interface

The external serial flash stores the user profiles and firmware patch updates. The CC3100 device acts as a master in this case; the SPI serial flash acts as the slave device. This interface can work up to a speed of 20 MHz.

Figure 4-14 shows the SPI flash interface.

**Figure 4-14. SPI Flash Interface**

Table 4-10 lists the SPI flash interface pins.

**Table 4-10. SPI Flash Interface**

### 4.11.2 SPI Host Interface

The device interfaces to an external host using the SPI interface. The CC3100 device can interrupt the host using the HOST\_INTR line to initiate the data transfer over the interface. The SPI host interface can work up to a speed of 20 MHz.

Figure 4-15 shows the SPI host interface.

Figure 4-15. SPI Host Interface

Table 4-11 lists the SPI host interface pins.

Table 4-11. SPI Host Interface

## 4.12 Host UART

The SimpleLink device requires the UART configuration described in Table 4-12.

Table 4-12. SimpleLink UART Configuration

Property	Supported CC3100 Configuration
Baud rate	115200 bps, no auto-baud rate detection, can be changed by the host up to 3 Mbps using a special command
Data bits	8 bits
Flow control	CTS/RTS
Parity	None
Stop bits	1
Bit order	LSBit first
Host interrupt polarity	Active high
Host interrupt mode	Rising edge or level 1
Endianness	Little-endian only <sup>(1)</sup>

(1) The SimpleLink device does not support automatic detection of the host length while using the UART interface.

### 4.12.1 5-Wire UART Topology

Figure 4-16 shows the typical 5-wire UART topology comprised of 4 standard UART lines plus one IRQ line from the device to the host controller to allow efficient low power mode.

Figure 4-16. Typical 5-Wire UART Topology

This is the typical and recommended UART topology because it offers the maximum communication reliability and flexibility between the host and the SimpleLink device.

### 4.12.2 4-Wire UART Topology

The 4-wire UART topology eliminates the host IRQ line (see Figure 4-17). Using this topology requires one of the following conditions to be met:

- Host is always awake or active.
- Host goes to sleep but the UART module has receiver start-edge detection for auto wakeup and does not lose data.

Figure 4-17. 4-Wire UART Configuration

### 4.12.3 3-Wire UART Topology

The 3-wire UART topology requires only the following lines (see Figure 4-18):

- RX
- TX
- CTS

Figure 4-18. 3-Wire UART Topology

Using this topology requires one of the following conditions to be met:

- Host always stays awake or active.

- Host goes to sleep but the UART module has receiver start-edge detection for auto wakeup and does not lose data.
- Host can always receive any amount of data transmitted by the SimpleLink device because there is no flow control in this direction.

Because there is no full flow control, the host cannot stop the SimpleLink device to send its data; thus, the following parameters must be carefully considered:

- Max baud rate
- RX character interrupt latency and low-level driver jitter buffer
- Time consumed by the user's application

## 5.4 Power-Management Subsystem

The CC3100 power-management subsystem contains DC-DC converters to accommodate the differing voltage or current requirements of the system.

- Digital DC-DC
  - Input: VBAT wide voltage (2.1 to 3.6 V) or preregulated 1.85 V
- ANA1 DC-DC
  - Input: VBAT wide voltage (2.1 to 3.6 V)
  - In preregulated 1.85-V mode, the ANA1 DC-DC converter is bypassed.
- PA DC-DC
  - Input: VBAT wide voltage (2.1 to 3.6 V)
  - In preregulated 1.85-V mode, the PA DC-DC converter is bypassed.

In preregulated 1.85-V mode, the ANA1 DC-DC and PA DC-DC converters are bypassed. The CC3100 device is a single-chip WLAN radio solution used on an embedded system with a wide-voltage supply range. The internal power management, including DC-DC converters and LDOs, generates all of the voltages required for the device to operate from a wide variety of input sources. For maximum flexibility, the device can operate in the modes described in the following sections.

### 5.4.1 VBAT Wide-Voltage Connection

In the wide-voltage battery connection, the device is powered directly by the battery. All other voltages required to operate the device are generated internally by the DC-DC converters. This scheme is the most common mode for the device as it supports wide-voltage operation from 2.1 to 3.6 V (for electrical connections, see [Section 6.1.1, Typical Application – CC3100 Wide-Voltage Mode](#)).

### 5.4.2 Preregulated 1.85 V

The preregulated 1.85-V mode of operation applies an external regulated 1.85 V directly at the pins 10, 25, 33, 36, 37, 39, 44, 48, and 54 of the device. The VBAT and the VIO are also connected to the 1.85-V supply. This mode provides the lowest BOM count version in which inductors used for PA DC-DC and ANA1 DC-DC (2.2 and 1  $\mu$ H) and a capacitor (22  $\mu$ F) can be avoided. For electrical connections, see [Section 6.1.2, Typical Application – CC3100 Preregulated 1.85-V Mode](#).

In the preregulated 1.85-V mode, the regulator providing the 1.85 V must have the following characteristics:

- Load current capacity  $\geq 900$  mA.
- Line and load regulation with  $< 2\%$  ripple with 500 mA step current and settling time of  $< 4$   $\mu$ s with the load step.
- The regulator must be placed very close to the CC3100 device so that the IR drop to the device is very low.

## 5.5 Low-Power Operating Modes

This section describes the low-power modes supported by the device to optimize battery life.

### 5.5.1 Low-Power Deep Sleep

The low-power deep-sleep (LPDS) mode is an energy-efficient and transparent sleep mode that is entered automatically during periods of inactivity based on internal power optimization algorithms. The device can wake up in less than 3 ms from the internal timer or from any incoming host command. Typical battery drain in this mode is 115  $\mu$ A. During LPDS mode, the device retains the software state and certain configuration information. The operation is transparent to the external host; thus, no additional handshake is required to enter or exit this sleep mode.

### 5.5.2 Hibernate

The hibernate mode is the lowest power mode in which all of the digital logic is power-gated. Only a small section of the logic powered directly by the main input supply is retained. The real-time clock (RTC) is kept running and the device wakes up once the n\_HIB line is asserted by the host driver. The wake-up time is longer than LPDS mode at about 50 ms.

## 5.6 Memory

### 5.6.1 External Memory Requirements

The CC3100 device maintains a proprietary file system on the SFLASH. The CC3100 file system stores the service pack file, system files, configuration files, certificate files, web page files, and user files. By using a format command through the API, users can provide the total size allocated for the file system. The starting address of the file system cannot be set and is always located at the beginning of the SFLASH. The applications microcontroller must access the SFLASH memory area allocated to the file system directly through the CC3100 file system. The applications microcontroller must not access the SFLASH memory area directly.

The file system manages the allocation of SFLASH blocks for stored files according to download order, which means that the location of a specific file is not fixed in all systems. Files are stored on SFLASH using human-readable file names rather than file IDs. The file system API works using plain text, and file encryption and decryption is invisible to the user. Encrypted files can be accessed only through the file system.

All file types can have a maximum of 128 supported files in the file system. All files are stored in blocks of 4KB and thus use a minimum of 4KB of flash space. Encrypted files with fail-safe support and optional security are twice the original size and use a minimum of 8KB. Encrypted files are counted as fail safe in terms of space. The maximum file size is 16MB.

Table 5-2 lists the SFLASH size recommendations.

**Table 5-2. CC3100 SFLASH Size Recommendations**

Item	Typical Fail-Safe	Typical NonFail-Safe
File system	20KB	20KB
Service pack	224KB	112KB
System and configuration files	216KB	108KB
Total	4Mb	2Mb
Recommended	8Mb	4Mb

The CC3100 device supports JEDEC specification SFDP (serial flash device parameters). The following SFLASH devices are verified for functionality with the CC3100 device in addition to the ones in the reference design:

- Micron (N25Q128-A13BSE40): 128Mb
- Spansion (S25FL208K): 8Mb
- Winbond (W25Q16V): 16Mb
- Adesto (AT25DF081A): 8Mb
- Macronix (MX25L12835F-M2): 128Mb

For compatibility with the CC3100 device, the SFLASH device must support the following commands:

- Command 0x9F (read the device ID [JEDEC]). Procedure: SEND 0x9F, READ 3 bytes.
- Command 0x05 (read the status of the SFLASH). Procedure: SEND 0x05, READ 1 byte. Assume bit 0 is busy and bit 1 is write enable.
- Command 0x06 (set write enable). Procedure: SEND 0x06, read status until write-enable bit is set.
- Command 0xC7 (chip erase). Procedure: SEND 0xC7, read status until busy bit is cleared.
- Command 0x03 (read data). Procedure: SEND 0x03, SEND 24-bit address, read  $n$  bytes.
- Command 0x02 (write page). Procedure: SEND 0x02, SEND 24-bit address, write  $n$  bytes ( $0 < n < 256$ ).
- Command 0x20 (sector erase). Procedure: SEND 0x20, SEND 24-bit address, read status until busy bit is cleared. Sector size is assumed to be always 4K.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

# THERMAL PAD MECHANICAL DATA

RGC (S-PVQFN-N64)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).
