

DACx0004 四通道 16 位、14 位、12 位 1LSB INL 缓冲电压输出数模转换器

1 特性

- 真正的 16 位性能：1 LSB 积分非线性 (INL)/微分非线性 (DNL)（最大值）
- 超低毛刺脉冲能量：1nV-s
- 宽电源电压范围：2.7V 至 5.5V
- 支持轨到轨运行的输出缓冲器
- 电流消耗：1mA/通道
- 50MHz、四线制或三线制串行外设接口 (SPI) 兼容接口
- 用于回读和菊花链连接的 SDO 引脚
- 上电复位至零量程或量程中点
- 温度范围：-40°C 至 +125°C
- 多种封装：
 - 微型 14 引脚超薄小外形尺寸无引线 (VSON) 封装
 - 14 引脚薄型小外形尺寸 (TSSOP) 封装

2 应用

- 便携式仪表
- 可编程逻辑控制器 (PLC) 模拟输出模块(4mA-20mA)
- 闭环伺服器控制
- 数据采集系统

3 说明

DAC80004/70004/60004 (DACx0004) 分别为 16 位、14 位和 12 位高精度、低功耗、电压输出、四通道数模转换器 (DAC)。DACx0004 器件通过设计可保证单调性，拥有低于 1 LSB（最大值）的出色线性度。

DAC 的基准输入在内部通过专用基准缓冲器进行缓冲。

DACx0004 器件配有上电复位电路，用于确保 DAC 输出在零量程或量程中点处上电（具体取决于 POR 引脚的状态）并保持该状态直到器件中写入有效编码为止。这些器件的电流消耗非常低（1mA/通道），是便携式、电池供电类设备的理想选择。这些器件还包含一种掉电特性。该特性可将 5V 电压下的流耗降至 3μA（典型值）。

DACx0004 器件使用一个运行时钟速率高达 50MHz 的通用三线制串口。DACx0004 器件还包含一个 SDO 引脚，该引脚能够以菊花链形式连接多个器件。此接口与标准 SPI™，QSPI™、Microwire 以及数字信号处理器 (DSP) 接口兼容。DACx0004 器件采用易于装配的 14 引脚 TSSOP 封装或超小型 14 引脚 VSON 封装，在 -40°C 至 +125°C 的扩展工业级温度范围内完全额定运行。

器件信息⁽¹⁾

器件型号	封装	封装尺寸（标称值）
DACx0004	VSON (14)	3.00mm x 4.00mm
DACx0004	TSSOP (14)	5.00mm x 4.40mm

DEVICE	RESOLUTION
DAC80004	16
DAC70004	14
DAC60004	12

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NUMBER		
$\overline{\text{CLR}}$	9	Digital Input	Clear DAC pin, falling edge sensitive
GND	12	Power	Ground
$\overline{\text{LDAC}}$	1	Digital Input	Load DAC pin, active low
POR	6	Digital Input	Power-on-reset configuration, Connecting the POR pin to GND powers up all four DACs to zero scale. Connecting this pin to VDD powers up all four DACs to midscale.
REFIN	7	Analog Input	Voltage reference input for all channels
SCLK	14	Digital Input	Serial interface shift clock
SDIN	13	Digital Input	Serial interface digital input
SDO	8	Digital Output	Serial interface digital output for readback and daisy chaining
$\overline{\text{SYNC}}$	2	Digital Input	Serial interface synchronization, active low
VDD	3	Power	Positive power supply (2.7 V to 5.5 V)
V _{OUTA}	4	Analog Output	DAC A output
V _{OUTB}	11	Analog Output	DAC B output
V _{OUTC}	5	Analog Output	DAC C output
V _{OUTD}	10	Analog Output	DAC D output

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	MIN	MAX	UNIT
Voltage, VDD to GND	−0.3	7	V
Voltage, digital input or output to GND	−0.3	V _{DD} + 0.3	V
Voltage, analog input (REFIN) or output (V _{OUTX}) to GND	−0.3	V _{DD} + 0.3	V
Input current to any pin except supply pins	−10	10	mA
Maximum junction temperature		150	°C
Storage temperature range, T _{stg}	−60	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Voltage, VDD to GND	2.7		5.5	V
Voltage, analog input (REFIN) or output (V _{OUTX}) to GND	2.7 V ≤ V _{DD} ≤ 4.5 V	2.2	V _{DD} − 0.2	V
	4.5 V ≤ V _{DD} ≤ 5.5 V	2.2	V _{DD}	V
Ambient Operating Temperature, T _A	−40		125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DACx0004		UNIT
		DMD (VSON)	PW (TSSOP)	
		14 PINS	14 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	39.6	99.1	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	27.3	23.4	°C/W
R _{θJB}	Junction-to-board thermal resistance	9.0	42.8	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.3	0.9	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	8.9	42.0	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	6.5	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Electrical Characteristics

All minimum/maximum specifications at $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $2.5\text{ V} \leq \text{REFIN}^{(1)} \leq V_{DD}$, $R_{\text{load}} = 5\text{ k}\Omega$ to GND, $C_{\text{load}} = 200\text{ pF}$ to GND (unless otherwise noted), Digital inputs held at 0 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

8 Detailed Description

8.1 Overview

The DAC80004, DAC70004, and DAC60004 are quad-channel, 16-bit, voltage-output DACs with internal reference buffers and output buffers. Each channel consists of an R-2R ladder configuration with the 4 MSBs segmented, followed by an operational amplifier, as shown in Figure 51. The DACx0004 devices have a constant impedance (30 kΩ typical), buffered reference input. The output of the reference buffers drives the R-2R ladders. With the production trim process these devices have excellent dc accuracy and ac performance.

Figure 51. DACx0004 Architecture

The input coding to the DACx0004 is straight binary, so the ideal output voltage is given by Equation 1:

$$V_{OUT} = \left(\frac{D_{IN}}{2^N} \right) \times REF_{IN} \quad (1)$$

Where:

N = resolution in bits; either 16 (DAC80004), 14 (DAC70004) or 12 (DAC60004)

D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register. D_{IN} ranges from 0 to 2^N – 1

REF_{IN} = DAC reference voltage

8.3 Feature Description

8.3.1 Output Amplifier

The DACx0004 output buffer amplifier is capable of generating near rail-to-rail voltages on its output, giving a maximum output range of 0 V to REFIN. It is capable of driving a load of 5 k Ω in parallel with 2 nF to GND. The typical slew rate of this amplifier while driving no load is 1.5 V/ μ s, with a full-scale settling time of 8 μ s to 1 LSB of the final value as shown in [Figure 43](#) and [Figure 44](#). The current consumption of the amplifier (unloaded) is 1 mA/channel (typical). The DACx0004 output amplifier also implements a short circuit current limiting circuit. The default value of short circuit limit is 40 mA, however this can be reduced to 30 mA using dedicated bits (1 per channel) via SPI command 1010 (see [Table 2](#)).

8.3.2 Reference Buffer

The DACx0004 requires an external reference to operate. The reference input pin has the following input range:

2.2 V to ($V_{DD} - 0.2$) for 2.7 V $\leq V_{DD} \leq 4.5$ V

2.2 V to V_{DD} for 4.5 V $\leq V_{DD} \leq 5.5$ V

The DACx0004 contains a dedicated reference buffer for each DAC channel. The REFIN pin drives the input of these buffers. The integrated reference buffers offers constant impedance of 30 k Ω (typical) at the REFIN pin. This simplifies the external reference drive circuit for the device.

8.3.3 Power-On Reset

The DACx0004 contain a power-on-reset circuit that controls the output voltage during power up. The power-on reset is useful in applications where it is important to know the state of the output of each DAC while the device is in the process of powering up. At power up all DAC registers are filled with power-on reset code (see [Table 1](#)).

8.3.3.1 POR Pin Feature

The DAC power-on reset code for all of the channels depends on the state of the POR pin at power up (see [Pin Configuration and Functions](#)).

Each DAC channel remains that way until a valid load command is written to it. All device registers are reset at power up as shown in [Table 1](#).

Table 1. DACx0004 Power-On Reset Values

REGISTER NAME	DACx0004 - POWER-ON RESET VALUE
	TSSOP-/VSON-14
DAC latches (per channel)	If POR pin = '0' then Zero Scale else Mid scale
DAC buffers (per channel)	If POR pin= '0' then Zero Scale else Mid scale
Power down (per channel)	00 – Normal mode
Clear mode	00 – Clear to Zero
Ignore LDAC (per channel)	0000 – Do not ignore
Daisy chain	0 – Daisy chain disabled, DAC update at 32nd SCLK falling edge
Short circuit limit (per channel)	0000 – all DACs 40 mA

8.3.3.2 Internal Power-On Reset (IPOR) Levels

When the device powers up, an IPOR circuit sets the device in default mode as shown in [Table 1](#). The IPOR circuit requires specific V_{DD} levels, as indicated in [Figure 52](#), to ensure discharging of internal capacitors and to reset the device on power up. In order to ensure a power-on reset, V_{DD} must be below 0.7 V for at least 1 ms. When V_{DD} drops below 2.4 V but remains above 0.7 V (shown as the undefined region), the device may or may not reset under all specified temperature and power supply conditions. In this case, In this case a power-down reset is recommended. When V_{DD} remains above 2.4 V, a power-on reset does not occur.

Figure 52. Relevant Voltage Levels for IPOR Circuit

8.4 Device Functional Modes

8.4.1 Serial Interface

The DACx0004 devices have a 4-wire serial interface: $\overline{\text{SYNC}}$, SCLK, SDIN, and SDO (see [Pin Configuration and Functions](#)). The serial interface (3-wire and 4-wire) is compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs and it operates up to 50 MHz. See the Write Mode Stand-Alone Timing and Write Mode Daisy-Chain Timing diagrams (see [Figure 1](#) and [Figure 2](#)) for examples of typical write and read sequences. The input shift register is 32 bits wide.

8.4.1.1 Stand-Alone Mode

The serial clock SCLK can be a continuous or a gated clock. The first falling edge of $\overline{\text{SYNC}}$ starts the operation cycle. When $\overline{\text{SYNC}}$ is high, the SCLK and SDIN signals are blocked and the SDO pin (TSSOP-14 and VSON-14 packages) is in a Hi-Z state. The device internal registers are updated from the shift register on the 32nd falling edge of SCLK.

8.4.1.1.1 $\overline{\text{SYNC}}$ Interrupt – Stand-Alone Mode

For stand-alone operation, the $\overline{\text{SYNC}}$ line stays low for at least 32 falling edges of SCLK and the addressed DAC register updates on the 32nd SCLK falling edge. However, if $\overline{\text{SYNC}}$ is brought high before the 32nd SCLK falling edge, it acts as an interrupt to the write sequence; the shift register resets and the write sequence is discarded. Neither an update of the data buffer contents, DAC register contents, nor a change in the operating mode occurs (as shown in [Figure 53](#)).

Figure 53. $\overline{\text{SYNC}}$ Interrupt – Stand Alone Operation

Device Functional Modes (continued)

8.4.1.1.2 Read-Back Mode

The READ command is used to start read-back operation. However, before read-back operation can be initiated, the SDO pin must be enabled by setting the DSDO bit to '1'; this bit is disabled by default. Read-back operation is then started by executing a READ command (R/W bit = '1', see Table 3). Bits C3 to C0 select the register to be read. The remaining data in the command are don't care bits. During the next SPI operation, the data appearing on the SDO output are from the previously addressed register. For a read of a single register, a NOP (No Operation) command (1110) can be used to clock out the data from the selected register on SDO. Multiple registers can be read if multiple READ commands are issued (see Figure 54).

Figure 54. Read-Back Operation

8.4.1.2 Daisy-Chain Mode

For systems that contain more than one device, the SDO pin can be used to daisy-chain multiple devices together (see Figure 55). Daisy-chain operation can be useful in system diagnostics and in reducing the number of serial interface lines. The daisy-chain feature can be enabled by writing a logic '1' to the DSDO bit (see Table 3); the SDO pin is set to HIZ when the DSDO bit is set to 0.

The first falling edge of $\overline{\text{SYNC}}$ starts the operating cycle. SCLK is continuously applied to the SPI shift register when $\overline{\text{SYNC}}$ is low. If more than 32 clock pulses are applied, the data ripples out of the shift register and appear on the SDO line. The data bits are clocked out on the rising edge of SCLK and are valid on the falling edge. By connecting the SDO pin of the first device to the SDI input of the next device in the chain, a multiple-device interface is constructed (see Figure 2). Each device in the system requires 32 clock pulses. Therefore, the total number of clock cycles must equal $32 \times N$, where N is the total number of DACx0004s in the chain. When the serial transfer to all devices is complete, $\overline{\text{SYNC}}$ is taken high. This action latches the data from the SPI shift registers to the device internal registers for each device in the daisy-chain and prevents any further data from being clocked in. The serial clock can be a continuous or a gated clock. Note that a continuous SCLK source can only be used if $\overline{\text{SYNC}}$ is held low for the correct number of clock cycles. For gated clock mode, a burst clock containing the exact number of clock cycles must be used and $\overline{\text{SYNC}}$ must be taken high after the final clock in order to latch the data.

Figure 55. DACx0004 in Daisy Chain Mode

8.4.1.2.1 $\overline{\text{SYNC}}$ Interrupt – Daisy-Chain Mode

For daisy-chain operation, the $\overline{\text{SYNC}}$ line stays low for at least $32 \times N$ SCLK cycles, where N is the number of DACx0004s in the daisy chain. If $\overline{\text{SYNC}}$ is brought high before a multiple 32 SCLKs, it acts as an interrupt to the write sequence; the shift register resets and the write sequence is discarded. Neither an update of the data buffer contents, DAC register contents, nor a change in the operating mode occurs (see Figure 56).

Device Functional Modes (continued)

Figure 56. SYNC Interrupt – Daisy-Chain Operation

8.4.2 SPI Shift Register

The SPI shift register is 32 bits wide, as shown in Table 2. The shift register command mapping is shown in Table 3. The DACx0004 accepts DAC code in straight binary format. Note that, the DAC data is left aligned from MSB (D19) to LSB (D4 - 16 bits, D6 - 14 bits, D8 - 12 bits).

Table 2. DACx0004 SPI Shift Register Format

D31	D30	D29	D28	D27-D24	D23-D20	D19-D04	D03-D00

0	0	1	0	Select channel C
0	0	1	1	Select channel D
1	1	1	1	Select all channel

8.4.3 DAC Power-Down Modes

The DACx0004 use four modes of operation. These modes are accessed by setting command bits D28 – D24 and power-down register bits D09 and D08. The command bits must be set to 0100 (see Table 3). Once the command bits are set correctly, the four different power-down modes are software programmable by setting bits D09 and D08 in the shift register. Table 5 shows how to control the operating mode with data bits PD1 (D09), PD0 (D08).

Table 5. Power-Down Bits

POWER DOWN BITS		DESCRIPTION
D09	D08	
0	0	Normal operation/power up selected channel(s) (Default)
0	1	Power down selected channel(s) 1 kΩ-GND
1	0	Power down selected channel(s) 100 kΩ-GND
1	1	Power down selected channel(s) Hi-Z

It is possible to write to the DAC register/buffer of the DAC channel that is powered down. When the DAC channel is then powered up, it powers up to this new value.

The advantage of the available power-down modes is that the output impedance of the device is known while it is in power-down mode. As described in Table 5, there are three different power-down options. V_{OUTX} can be connected internally to GND through a 1 kΩ resistor, a 100 kΩ resistor, or open-circuited (Hi-Z). The DAC power-down circuitry is shown in Figure 57.

Figure 57. DACx0004 Power Down

8.4.4 $\overline{\text{CLR}}$ Pin Functionality and Software CLEAR Mode

The $\overline{\text{CLR}}$ pin is an asynchronous input pin to the DAC. When activated, this falling edge sensitive pin clears the DAC buffers and the DAC latches to zero, mid, full or user programmed code depending on the clear mode register (see Table 6). The default setting for clear operation is clear to 0 V. The device exits clear mode on the 32nd falling edge of the next write to the device. If the $\overline{\text{CLR}}$ pin receives a falling edge signal during a write sequence in normal operation, the clear mode is activated and changes the input and DAC registers immediately. Additionally, all DAC registers can also be cleared via SPI command 1011. Note that the clear mode bits determine the clear code for all the DACs upon clear operation.

8.4.4.1 DAC Clear Mode Registers

The DACx0004 implement four different clear modes. These modes are accessed by setting command bits D28 – D24 and clear mode register bits D01 and D00. The command bits must be set to 0101 (see Table 3). Based on the value of clear mode register (see Table 6), all of the DAC and the buffers are cleared to zero, mid, or full-scale code, when the $\overline{\text{CLR}}$ pin sees a falling edge or after a software clear command is issued.

The user defined clear scale can be set by writing 16-/14-/12- data to 1001 to bits D28 – D24.

Table 6. Clear Mode Bits

CLEAR MODE BITS		DESCRIPTION
D01	D00	
0	0	All DACs clear to zero scale (default)
0	1	All DACs clear to mid scale
1	0	All DACs clear to full scale

8.4.5 $\overline{\text{LDAC}}$ Pin Functionality

The DACx0004 devices offer both a software and hardware simultaneous update and control function. The DAC double-buffered architecture has been designed so that new data can be entered for each DAC without disturbing the analog outputs. Data updates can be performed either in synchronous or in asynchronous mode.

In asynchronous mode, the $\overline{\text{LDAC}}$ pin is used as an active low signal for simultaneous DAC updates. Multiple single-channel writes can be done in order to set different channel buffers to desired values and then pulse the $\overline{\text{LDAC}}$ pin low to simultaneously update the DAC output registers. Data buffers of all channels must be loaded with desired data before an $\overline{\text{LDAC}}$ low pulse. After a $\overline{\text{LDAC}}$ low pulse, all DACs are simultaneously updated with the last contents of the corresponding data buffers. If the content of a data buffer is not changed, the corresponding DAC output remains unchanged after the $\overline{\text{LDAC}}$ pin is pulsed low.

In synchronous mode, data are updated with the falling edge of the 32nd SCLK cycle, which follows a falling edge of SYNC. For such synchronous updates, the $\overline{\text{LDAC}}$ pin is not required, and it must be connected to GND permanently or asserted and held low before sending commands to the device.

8.4.5.1 Software $\overline{\text{LDAC}}$ Mode Registers

Alternatively, all DAC outputs can be updated simultaneously using the built-in software function of $\overline{\text{LDAC}}$. The $\overline{\text{LDAC}}$ register offers additional flexibility and control by allowing the selection of which DAC channel(s) should be updated simultaneously when the $\overline{\text{LDAC}}$ pin is being brought low. The $\overline{\text{LDAC}}$ register is loaded with a 4-bit word (D03 and D00) using command bits D28 – D24 (see Table 3). The default value for each bit, and therefore for each DAC channel, is zero. If the $\overline{\text{LDAC}}$ register bit is set to 1, it overrides the $\overline{\text{LDAC}}$ pin (the $\overline{\text{LDAC}}$ pin is internally tied low for that particular DAC channel), and this DAC channel updates synchronously after the falling edge of the 32nd SCLK cycle. However, if the $\overline{\text{LDAC}}$ register bit is set to 0, the DAC channel is controlled by the $\overline{\text{LDAC}}$ pin.

See Table 7 for more information.

Table 7. $\overline{\text{LDAC}}$ Register

$\overline{\text{LDAC}}$ REGISTER BITS (D03 – D00)	DAC UPDATE
0	Determined by $\overline{\text{LDAC}}$ pin (Default)
1	DAC channel ignores $\overline{\text{LDAC}}$ pin, DAC updates on 32nd falling edge of SCLK, DAC channels see $\overline{\text{LDAC}}$ as 0

8.4.6 Software Reset Mode

The DACx0004 implements a software reset feature. The software reset function uses command bits D28 – D24 (see Table 3). Table 1 shows the reset values for different registers.

8.4.7 Output Short Circuit Limit Register

The DACx0004 output amplifier has a default short circuit limit of 40 mA. However, this limit can be reduced to 30 mA by using command 1010 on bits D28 – D24 and selecting channel(s) (D03 – D00). Please note that DACx0004 has a dedicated bit per channel, this allows the user to set different short circuit limit for different DAC output channels.

Table 8. Short Circuit Limit Register

SHORT CIRCUIT LIMIT REGISTER BITS (D03 – D00)	DAC SHORT CIRCUIT LIMIT
0	DAC output short circuit limit = 40 mA (Default)
1	DAC output short circuit limit = 30 mA

8.4.8 Status Register

The DACx0004 implements a read-only status register (see [Table 3](#)). This register can be read by using command 1101 on bits D28 – D24, followed by a NOP command.

Logic '1' on bit D04 indicates that the device is ready to be used. This feature is useful to check if the device is ready to accept commands after power up.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.2 Typical Application - Digitally Controlled Asymmetric Bipolar Output

Figure 58. Asymmetric Bipolar Output Block Diagram

9.2.1 Design Requirements

This design requires two channels of the DACx0004 to generate a bipolar output. The design is very flexible and allows for many different configurations. Typically, one channel is used to finely control the output, while the other is used to offset the output. The direction of the offset depends on which channel is used as an offset. DAC_{POS} provides a positive offset and DAC_{NEG} has a negative offset.

9.2.2 Detailed Design Procedure

The output of each DAC can be modified via the digital interface and the gain of each output can be modified independently by changing the external resistors. In order for the gain of each offset to be independent, Equation 2 must be true.

$$R_A = \left(\frac{1}{R_{FB}} + \frac{1}{R_{NEG}} - \frac{1}{R_{POS}} \right)^{-1} \quad (2)$$

The output voltage range, V_{OUT}, is adjusted according to Equation 3. Keep in mind that Equation 3 is only true when Equation 2 is true.

$$V_{OUT} = DAC_{POS} \times \frac{R_{FB}}{R_{POS}} - DAC_{NEG} \times \frac{R_{FB}}{R_{NEG}} \quad (3)$$

Each DAC outputs a voltage from 0 to REFIN. As an example, if DAC_{POS} gain is 1, DAC_{NEG} gain is 2 and R_{FB} = 2 kΩ, then R_{POS} = 2 kΩ, R_{NEG} = 1 kΩ and R_A = 1 kΩ. With the correct digital implementation it gives the output an effective output range of ±15 V, with discrete 16-bit steps.

Typical Application - Digitally Controlled Asymmetric Bipolar Output (continued)

9.2.3 Application Curve

Figure 59 displays two different modes of operation. Mode 1 gains the output of DAC_{Neg} by a factor of 2 and maintains DAC_{POS} at unity gain. Mode 2 reverses the gains of each stage to invert the system. These are just two examples of the types of outputs that can be achieved using this configuration.

Figure 59. Output Voltage vs Fine DAC Input Code

10 Power Supply Recommendations

The DACx0004 can operate within the specified supply voltage range of 2.7 V to 5.5 V. The power applied to VDD should be well-regulated and have low-noise. Switching power supplies and DC-DC converters often have high frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high frequency spikes. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. A 1 μ F to 10 μ F capacitor and 0.1 μ F bypass capacitor is recommended in order to further minimize noise from the power supply. The current consumption on the VDD pin, the short-circuit current limit, and the load current for the device are listed in the [Electrical Characteristics](#). The power supply must meet the aforementioned current requirements.

11 Layout

11.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies. As a general rule it is important to keep digital traces as far away from analog traces when possible.

The DACx0004 is often used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to keep digital noise from appearing at the output.

Due to the single ground pin of the DACx0004, all return currents, including digital and analog return currents for the DAC, must flow through a single point. Ideally, GND must be connected directly to an analog ground plane. This plane must be separate from the ground connection for the digital components until they were connected at the power-entry point of the system.

As with the GND connection, VDD should be connected to a 5 V power-supply plane or trace that is separate from the connection for digital logic until they are connected at the power-entry point. It is recommended to have an additional 1 μ F to 10 μ F capacitor and 0.1 μ F bypass capacitor. In some situations, additional bypassing may be required, such as a 100 μ F electrolytic capacitor or even a Pi filter made up of inductors and capacitors—all designed to essentially low-pass filter the 5 V supply, removing the high-frequency noise. In general it is always a good idea to maintain the digital signals away from analog signals.

DAC80004IPWR	ACTIVE	TSSOP	PW	14	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	DA80004	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
 - E. Falls within JEDEC MO-153

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4221688/A 09/2014

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

DMD0014A

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE
SCALE:20X

SOLDER MASK DETAILS

4221688/A 09/2014

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DMD0014A

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD
80% PRINTED SOLDER COVERAGE BY AREA
SCALE:20X

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和该等应用中所用 TI 产品的功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或在使用 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负任何责任，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理层人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
