

# DACx0004, Quad 16-,14-,12-Bit, 1 LSB INL, Buffered, Voltage-Output Digital-to-Analog Converters

## 1 Features

- True 16-Bit Performance: 1 LSB INL/DNL (Max)
- Ultra Low Glitch Energy: 1 nV-s
- Wide Power-Supply Range: 2.7 V to 5.5 V
- Output Buffer with Rail-to-Rail Operation
- Current Consumption: 1 mA/Channel
- 50-MHz, 4- or 3-Wire SPI Compatible Interface
- SDO Pin for Readback and Daisy Chain
- Power-On Reset to Zero or Mid Scale
- Temperature Range:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Multiple Packages:
  - Tiny 14-Pin VSON
  - 14-Pin TSSOP

## 2 Applications

- Portable Instrumentation
- PLC Analog Output Module (4-20 mA)
- Closed-Loop Servo Control
- Data Acquisition Systems

## 3 Description

The DAC80004/70004/60004 (DACx0004) are highly accurate, low-power, voltage-output, quad-channel, 16-, 14-, 12-bit digital-to-analog converters (DACs) respectively. The DACx0004 devices are ensured monotonic by design and offer excellent linearity of less than 1 LSB (Max). The reference input of the DAC is buffered internally using a dedicated reference buffer.

The DACx0004 devices incorporate a power-on-reset circuit that ensures the DAC output powers up at zero scale or mid scale depending on status of the POR pin and remains in this state until a valid code is written to the device. These devices consume very low current of 1 mA/channel making them ideal for portable, battery-operated equipment. These devices also contain a power-down feature that reduces current consumption to typically 3  $\mu\text{A}$  at 5 V.

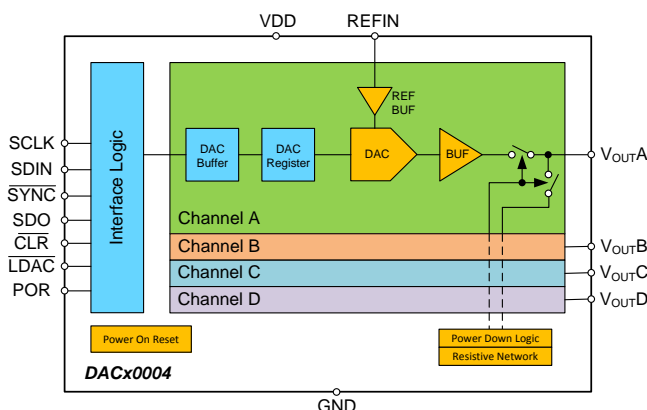

The DACx0004 devices use a versatile 4- or 3-wire serial interface that operates at clock rates up to 50 MHz. The DACx0004 devices also include a SDO pin to daisy chain multiple devices. The interface is compatible with standard SPI™, QSPI™, Microwire, and digital signal processor (DSP) interfaces. The DACx0004 devices are offered in easy-to-assemble 14-pin TSSOP packages or an ultra small 14-pin VSON package and are fully specified over the extended industrial temperature range of  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DACx0004	VSON (14)	3.00 mm x 4.00 mm
DACx0004	TSSOP (14)	5.00 mm x 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

DEVICE	RESOLUTION
DAC80004	16
DAC70004	14
DAC60004	12

## 6 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NUMBER		
$\overline{\text{CLR}}$	9	Digital Input	Clear DAC pin, falling edge sensitive
GND	12	Power	Ground
$\overline{\text{LDAC}}$	1	Digital Input	Load DAC pin, active low
POR	6	Digital Input	Power-on-reset configuration, Connecting the POR pin to GND powers up all four DACs to zero scale. Connecting this pin to VDD powers up all four DACs to midscale.
REFIN	7	Analog Input	Voltage reference input for all channels
SCLK	14	Digital Input	Serial interface shift clock
SDIN	13	Digital Input	Serial interface digital input
SDO	8	Digital Output	Serial interface digital output for readback and daisy chaining
$\overline{\text{SYNC}}$	2	Digital Input	Serial interface synchronization, active low
VDD	3	Power	Positive power supply (2.7 V to 5.5 V)
V <sub>OUTA</sub>	4	Analog Output	DAC A output
V <sub>OUTB</sub>	11	Analog Output	DAC B output
V <sub>OUTC</sub>	5	Analog Output	DAC C output
V <sub>OUTD</sub>	10	Analog Output	DAC D output

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

	MIN	MAX	UNIT
Voltage, VDD to GND	-0.3	7	V
Voltage, digital input or output to GND	-0.3	V <sub>DD</sub> + 0.3	V
Voltage, analog input (REFIN) or output (V <sub>OUTX</sub> ) to GND	-0.3	V <sub>DD</sub> + 0.3	V
Input current to any pin except supply pins	-10	10	mA
Maximum junction temperature		150	°C
Storage temperature range, T <sub>stg</sub>	-60	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Voltage, VDD to GND		2.7		5.5	V
Voltage, analog input (REFIN) or output (V <sub>OUTX</sub> ) to GND	2.7 V ≤ V <sub>DD</sub> ≤ 4.5 V	2.2		V <sub>DD</sub> - 0.2	V
	4.5 V ≤ V <sub>DD</sub> ≤ 5.5 V	2.2		V <sub>DD</sub>	V
Ambient Operating Temperature, T <sub>A</sub>		-40		125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DACx0004		UNIT
		DMD (VSON)	PW (TSSOP)	
		14 PINS	14 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	39.6	99.1	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	27.3	23.4	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	9.0	42.8	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.3	0.9	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	8.9	42.0	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	6.5	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

All minimum/maximum specifications at  $T_A = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ ,  $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$ ,  $2.5\text{ V} \leq \text{REFIN}^{(1)} \leq V_{DD}$ ,  $R_{\text{load}} = 5\text{ k}\Omega$  to GND,  $C_{\text{load}} = 200\text{ pF}$  to GND (unless otherwise noted), Digital inputs held at 0 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

## 8 Detailed Description

### 8.1 Overview

The DAC80004, DAC70004, and DAC60004 are quad-channel, 16-bit, voltage-output DACs with internal reference buffers and output buffers. Each channel consists of an R-2R ladder configuration with the 4 MSBs segmented, followed by an operational amplifier, as shown in Figure 51. The DACx0004 devices have a constant impedance (30 kΩ typical), buffered reference input. The output of the reference buffers drives the R-2R ladders. With the production trim process these devices have excellent dc accuracy and ac performance.

Figure 51. DACx0004 Architecture

The input coding to the DACx0004 is straight binary, so the ideal output voltage is given by Equation 1:

$$V_{OUT} = \left( \frac{D_{IN}}{2^N} \right) \times REF_{IN} \tag{1}$$

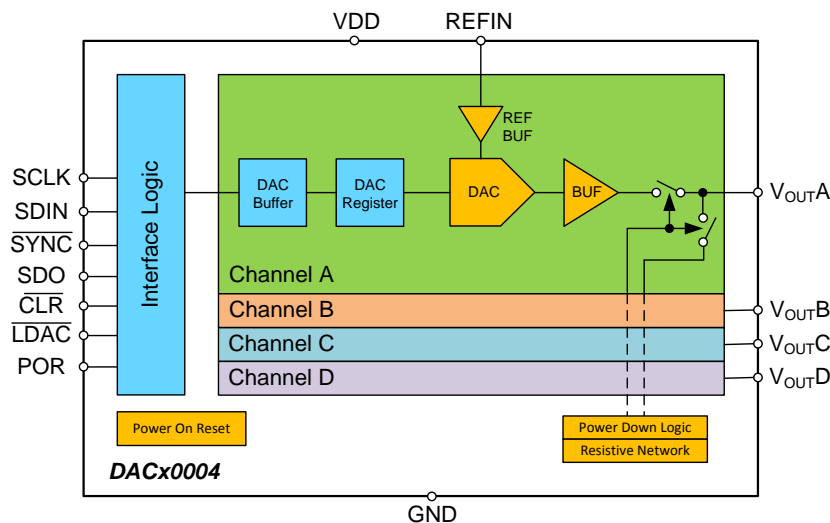

Where:

N = resolution in bits; either 16 (DAC80004), 14 (DAC70004) or 12 (DAC60004)

D<sub>IN</sub> = decimal equivalent of the binary code that is loaded to the DAC register. D<sub>IN</sub> ranges from 0 to 2<sup>N</sup> – 1

REF<sub>IN</sub> = DAC reference voltage

## 8.3 Feature Description

### 8.3.1 Output Amplifier

The DACx0004 output buffer amplifier is capable of generating near rail-to-rail voltages on its output, giving a maximum output range of 0 V to REFIN. It is capable of driving a load of 5 k $\Omega$  in parallel with 2 nF to GND. The typical slew rate of this amplifier while driving no load is 1.5 V/ $\mu$ s, with a full-scale settling time of 8  $\mu$ s to 1 LSB of the final value as shown in [Figure 43](#) and [Figure 44](#). The current consumption of the amplifier (unloaded) is 1 mA/channel (typical). The DACx0004 output amplifier also implements a short circuit current limiting circuit. The default value of short circuit limit is 40 mA, however this can be reduced to 30 mA using dedicated bits (1 per channel) via SPI command 1010 (see [Table 2](#)).

### 8.3.2 Reference Buffer

The DACx0004 requires an external reference to operate. The reference input pin has the following input range:

$$2.2 \text{ V to } (V_{DD} - 0.2) \text{ for } 2.7 \text{ V} \leq V_{DD} \leq 4.5 \text{ V}$$

$$2.2 \text{ V to } V_{DD} \text{ for } 4.5 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$$

The DACx0004 contains a dedicated reference buffer for each DAC channel. The REFIN pin drives the input of these buffers. The integrated reference buffers offers constant impedance of 30 k $\Omega$  (typical) at the REFIN pin. This simplifies the external reference drive circuit for the device.

### 8.3.3 Power-On Reset

The DACx0004 contain a power-on-reset circuit that controls the output voltage during power up. The power-on reset is useful in applications where it is important to know the state of the output of each DAC while the device is in the process of powering up. At power up all DAC registers are filled with power-on reset code (see [Table 1](#)).

#### 8.3.3.1 POR Pin Feature

The DAC power-on reset code for all of the channels depends on the state of the POR pin at power up (see [Pin Configuration and Functions](#)).

Each DAC channel remains that way until a valid load command is written to it. All device registers are reset at power up as shown in [Table 1](#).

**Table 1. DACx0004 Power-On Reset Values**

REGISTER NAME	DACx0004 - POWER-ON RESET VALUE
	TSSOP-/VSON-14
DAC latches (per channel)	If POR pin = '0' then Zero Scale else Mid scale
DAC buffers (per channel)	If POR pin= '0' then Zero Scale else Mid scale
Power down (per channel)	00 – Normal mode
Clear mode	00 – Clear to Zero
Ignore LDAC (per channel)	0000 – Do not ignore
Daisy chain	0 – Daisy chain disabled, DAC update at 32nd SCLK falling edge
Short circuit limit (per channel)	0000 – all DACs 40 mA

#### 8.3.3.2 Internal Power-On Reset (IPOR) Levels

When the device powers up, an IPOR circuit sets the device in default mode as shown in [Table 1](#). The IPOR circuit requires specific  $V_{DD}$  levels, as indicated in [Figure 52](#), to ensure discharging of internal capacitors and to reset the device on power up. In order to ensure a power-on reset,  $V_{DD}$  must be below 0.7 V for at least 1 ms. When  $V_{DD}$  drops below 2.4 V but remains above 0.7 V (shown as the undefined region), the device may or may not reset under all specified temperature and power supply conditions. In this case, In this case a power-down reset is recommended. When  $V_{DD}$  remains above 2.4 V, a power-on reset does not occur.

Figure 52. Relevant Voltage Levels for IPOR Circuit

## 8.4 Device Functional Modes

### 8.4.1 Serial Interface

The DACx0004 devices have a 4-wire serial interface:  $\overline{\text{SYNC}}$ , SCLK, SDIN, and SDO (see [Pin Configuration and Functions](#)). The serial interface (3-wire and 4-wire) is compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs and it operates up to 50 MHz. See the Write Mode Stand-Alone Timing and Write Mode Daisy-Chain Timing diagrams (see [Figure 1](#) and [Figure 2](#)) for examples of typical write and read sequences. The input shift register is 32 bits wide.

#### 8.4.1.1 Stand-Alone Mode

The serial clock SCLK can be a continuous or a gated clock. The first falling edge of  $\overline{\text{SYNC}}$  starts the operation cycle. When  $\overline{\text{SYNC}}$  is high, the SCLK and SDIN signals are blocked and the SDO pin (TSSOP-14 and VSON-14 packages) is in a Hi-Z state. The device internal registers are updated from the shift register on the 32nd falling edge of SCLK.

##### 8.4.1.1.1 $\overline{\text{SYNC}}$ Interrupt – Stand-Alone Mode

For stand-alone operation, the  $\overline{\text{SYNC}}$  line stays low for at least 32 falling edges of SCLK and the addressed DAC register updates on the 32nd SCLK falling edge. However, if  $\overline{\text{SYNC}}$  is brought high before the 32nd SCLK falling edge, it acts as an interrupt to the write sequence; the shift register resets and the write sequence is discarded. Neither an update of the data buffer contents, DAC register contents, nor a change in the operating mode occurs (as shown in [Figure 53](#)).

Figure 53.  $\overline{\text{SYNC}}$  Interrupt – Stand Alone Operation

## Device Functional Modes (continued)

### 8.4.1.1.2 Read-Back Mode

The READ command is used to start read-back operation. However, before read-back operation can be initiated, the SDO pin must be enabled by setting the DSDO bit to '1'; this bit is disabled by default. Read-back operation is then started by executing a READ command (R/W bit = '1', see Table 3). Bits C3 to C0 select the register to be read. The remaining data in the command are don't care bits. During the next SPI operation, the data appearing on the SDO output are from the previously addressed register. For a read of a single register, a NOP (No Operation) command (1110) can be used to clock out the data from the selected register on SDO. Multiple registers can be read if multiple READ commands are issued (see Figure 54).

Figure 54. Read-Back Operation

### 8.4.1.2 Daisy-Chain Mode

For systems that contain more than one device, the SDO pin can be used to daisy-chain multiple devices together (see Figure 55). Daisy-chain operation can be useful in system diagnostics and in reducing the number of serial interface lines. The daisy-chain feature can be enabled by writing a logic '1' to the DSDO bit (see Table 3); the SDO pin is set to HIZ when the DSDO bit is set to 0.

The first falling edge of  $\overline{\text{SYNC}}$  starts the operating cycle. SCLK is continuously applied to the SPI shift register when  $\overline{\text{SYNC}}$  is low. If more than 32 clock pulses are applied, the data ripples out of the shift register and appear on the SDO line. The data bits are clocked out on the rising edge of SCLK and are valid on the falling edge. By connecting the SDO pin of the first device to the SDI input of the next device in the chain, a multiple-device interface is constructed (see Figure 2). Each device in the system requires 32 clock pulses. Therefore, the total number of clock cycles must equal  $32 \times N$ , where N is the total number of DACx0004s in the chain. When the serial transfer to all devices is complete,  $\overline{\text{SYNC}}$  is taken high. This action latches the data from the SPI shift registers to the device internal registers for each device in the daisy-chain and prevents any further data from being clocked in. The serial clock can be a continuous or a gated clock. Note that a continuous SCLK source can only be used if  $\overline{\text{SYNC}}$  is held low for the correct number of clock cycles. For gated clock mode, a burst clock containing the exact number of clock cycles must be used and  $\overline{\text{SYNC}}$  must be taken high after the final clock in order to latch the data.

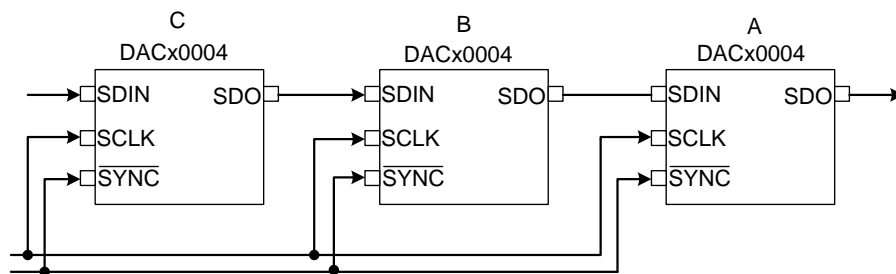

Figure 55. DACx0004 in Daisy Chain Mode

#### 8.4.1.2.1 $\overline{\text{SYNC}}$ Interrupt – Daisy-Chain Mode

For daisy-chain operation, the  $\overline{\text{SYNC}}$  line stays low for at least  $32 \times N$  SCLK cycles, where N is the number of DACx0004s in the daisy chain. If  $\overline{\text{SYNC}}$  is brought high before a multiple 32 SCLKs, it acts as an interrupt to the write sequence; the shift register resets and the write sequence is discarded. Neither an update of the data buffer contents, DAC register contents, nor a change in the operating mode occurs (see Figure 56).

## Device Functional Modes (continued)

Figure 56. SYNC Interrupt – Daisy-Chain Operation

### 8.4.2 SPI Shift Register

The SPI shift register is 32 bits wide, as shown in Table 2. The shift register command mapping is shown in Table 3. The DACx0004 accepts DAC code in straight binary format. Note that, the DAC data is left aligned from MSB (D19) to LSB (D4 - 16 bits, D6 - 14 bits, D8 - 12 bits).

Table 2. DACx0004 SPI Shift Register Format

### 8.4.3 DAC Power-Down Modes

The DACx0004 use four modes of operation. These modes are accessed by setting command bits D28 – D24 and power-down register bits D09 and D08. The command bits must be set to 0100 (see Table 3). Once the command bits are set correctly, the four different power-down modes are software programmable by setting bits D09 and D08 in the shift register. Table 5 shows how to control the operating mode with data bits PD1 (D09), PD0 (D08).

Table 5. Power-Down Bits

POWER DOWN BITS		DESCRIPTION
D09	D08	
0	0	Normal operation/power up selected channel(s) (Default)
0	1	Power down selected channel(s) 1 kΩ-GND
1	0	Power down selected channel(s) 100 kΩ-GND
1	1	Power down selected channel(s) Hi-Z

It is possible to write to the DAC register/buffer of the DAC channel that is powered down. When the DAC channel is then powered up, it powers up to this new value.

The advantage of the available power-down modes is that the output impedance of the device is known while it is in power-down mode. As described in Table 5, there are three different power-down options.  $V_{OUTX}$  can be connected internally to GND through a 1 kΩ resistor, a 100 kΩ resistor, or open-circuited (Hi-Z). The DAC power-down circuitry is shown in Figure 57.

Figure 57. DACx0004 Power Down

### 8.4.4 $\overline{\text{CLR}}$ Pin Functionality and Software CLEAR Mode

The  $\overline{\text{CLR}}$  pin is an asynchronous input pin to the DAC. When activated, this falling edge sensitive pin clears the DAC buffers and the DAC latches to zero, mid, full or user programmed code depending on the clear mode register (see Table 6). The default setting for clear operation is clear to 0 V. The device exits clear mode on the 32nd falling edge of the next write to the device. If the  $\overline{\text{CLR}}$  pin receives a falling edge signal during a write sequence in normal operation, the clear mode is activated and changes the input and DAC registers immediately. Additionally, all DAC registers can also be cleared via SPI command 1011. Note that the clear mode bits determine the clear code for all the DACs upon clear operation.

#### 8.4.4.1 DAC Clear Mode Registers

The DACx0004 implement four different clear modes. These modes are accessed by setting command bits D28 – D24 and clear mode register bits D01 and D00. The command bits must be set to 0101 (see Table 3). Based on the value of clear mode register (see Table 6), all of the DAC and the buffers are cleared to zero, mid, or full-scale code, when the  $\overline{\text{CLR}}$  pin sees a falling edge or after a software clear command is issued.

The user defined clear scale can be set by writing 16-/14-/12- data to 1001 to bits D28 – D24.

**Table 6. Clear Mode Bits**

CLEAR MODE BITS		DESCRIPTION
D01	D00	
0	0	All DACs clear to zero scale (default)
0	1	All DACs clear to mid scale
1	0	All DACs clear to full scale

### 8.4.5 $\overline{\text{LDAC}}$ Pin Functionality

The DACx0004 devices offer both a software and hardware simultaneous update and control function. The DAC double-buffered architecture has been designed so that new data can be entered for each DAC without disturbing the analog outputs. Data updates can be performed either in synchronous or in asynchronous mode.

In asynchronous mode, the  $\overline{\text{LDAC}}$  pin is used as an active low signal for simultaneous DAC updates. Multiple single-channel writes can be done in order to set different channel buffers to desired values and then pulse the  $\overline{\text{LDAC}}$  pin low to simultaneously update the DAC output registers. Data buffers of all channels must be loaded with desired data before an  $\overline{\text{LDAC}}$  low pulse. After a  $\overline{\text{LDAC}}$  low pulse, all DACs are simultaneously updated with the last contents of the corresponding data buffers. If the content of a data buffer is not changed, the corresponding DAC output remains unchanged after the  $\overline{\text{LDAC}}$  pin is pulsed low.

In synchronous mode, data are updated with the falling edge of the 32nd SCLK cycle, which follows a falling edge of SYNC. For such synchronous updates, the  $\overline{\text{LDAC}}$  pin is not required, and it must be connected to GND permanently or asserted and held low before sending commands to the device.

#### 8.4.5.1 Software $\overline{\text{LDAC}}$ Mode Registers

Alternatively, all DAC outputs can be updated simultaneously using the built-in software function of  $\overline{\text{LDAC}}$ . The  $\overline{\text{LDAC}}$  register offers additional flexibility and control by allowing the selection of which DAC channel(s) should be updated simultaneously when the  $\overline{\text{LDAC}}$  pin is being brought low. The  $\overline{\text{LDAC}}$  register is loaded with a 4-bit word (D03 and D00) using command bits D28 – D24 (see Table 3). The default value for each bit, and therefore for each DAC channel, is zero. If the  $\overline{\text{LDAC}}$  register bit is set to 1, it overrides the  $\overline{\text{LDAC}}$  pin (the  $\overline{\text{LDAC}}$  pin is internally tied low for that particular DAC channel), and this DAC channel updates synchronously after the falling edge of the 32nd SCLK cycle. However, if the  $\overline{\text{LDAC}}$  register bit is set to 0, the DAC channel is controlled by the  $\overline{\text{LDAC}}$  pin.

See Table 7 for more information.

**Table 7.  $\overline{\text{LDAC}}$  Register**

$\overline{\text{LDAC}}$ REGISTER BITS (D03 – D00)	DAC UPDATE
0	Determined by $\overline{\text{LDAC}}$ pin (Default)
1	DAC channel ignores $\overline{\text{LDAC}}$ pin, DAC updates on 32nd falling edge of SCLK, DAC channels see $\overline{\text{LDAC}}$ as 0

### 8.4.6 Software Reset Mode

The DACx0004 implements a software reset feature. The software reset function uses command bits D28 – D24 (see Table 3). Table 1 shows the reset values for different registers.

### 8.4.7 Output Short Circuit Limit Register

The DACx0004 output amplifier has a default short circuit limit of 40 mA. However, this limit can be reduced to 30 mA by using command 1010 on bits D28 – D24 and selecting channel(s) (D03 – D00). Please note that DACx0004 has a dedicated bit per channel, this allows the user to set different short circuit limit for different DAC output channels.

**Table 8. Short Circuit Limit Register**

SHORT CIRCUIT LIMIT REGISTER BITS (D03 – D00)	DAC SHORT CIRCUIT LIMIT
0	DAC output short circuit limit = 40 mA (Default)
1	DAC output short circuit limit = 30 mA

### 8.4.8 Status Register

The DACx0004 implements a read-only status register (see [Table 3](#)). This register can be read by using command 1101 on bits D28 – D24, followed by a NOP command.

Logic '1' on bit D04 indicates that the device is ready to be used. This feature is useful to check if the device is ready to accept commands after power up.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

### 9.2 Typical Application - Digitally Controlled Asymmetric Bipolar Output

**Figure 58. Asymmetric Bipolar Output Block Diagram**

#### 9.2.1 Design Requirements

This design requires two channels of the DACx0004 to generate a bipolar output. The design is very flexible and allows for many different configurations. Typically, one channel is used to finely control the output, while the other is used to offset the output. The direction of the offset depends on which channel is used as an offset. DAC<sub>POS</sub> provides a positive offset and DAC<sub>NEG</sub> has a negative offset.

#### 9.2.2 Detailed Design Procedure

The output of each DAC can be modified via the digital interface and the gain of each output can be modified independently by changing the external resistors. In order for the gain of each offset to be independent, [Equation 2](#) must be true.

$$R_A = \left( \frac{1}{R_{FB}} + \frac{1}{R_{NEG}} - \frac{1}{R_{POS}} \right)^{-1} \quad (2)$$

The output voltage range,  $V_{OUT}$ , is adjusted according to [Equation 3](#). Keep in mind that [Equation 3](#) is only true when [Equation 2](#) is true.

$$V_{OUT} = DAC_{POS} \times \frac{R_{FB}}{R_{POS}} - DAC_{NEG} \times \frac{R_{FB}}{R_{NEG}} \quad (3)$$

Each DAC outputs a voltage from 0 to REFIN. As an example, if DAC<sub>POS</sub> gain is 1, DAC<sub>NEG</sub> gain is 2 and  $R_{FB} = 2 \text{ k}\Omega$ , then  $R_{POS} = 2 \text{ k}\Omega$ ,  $R_{NEG} = 1 \text{ k}\Omega$  and  $R_A = 1 \text{ k}\Omega$ . With the correct digital implementation it gives the output an effective output range of  $\pm 15 \text{ V}$ , with discrete 16-bit steps.

**Typical Application - Digitally Controlled Asymmetric Bipolar Output (continued)**

**9.2.3 Application Curve**

Figure 59 displays two different modes of operation. Mode 1 gains the output of DAC<sub>Neg</sub> by a factor of 2 and maintains DAC<sub>POS</sub> at unity gain. Mode 2 reverses the gains of each stage to invert the system. These are just two examples of the types of outputs that can be achieved using this configuration.

**Figure 59. Output Voltage vs Fine DAC Input Code**

## 10 Power Supply Recommendations

The DACx0004 can operate within the specified supply voltage range of 2.7 V to 5.5 V. The power applied to VDD should be well-regulated and have low-noise. Switching power supplies and DC-DC converters often have high frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high frequency spikes. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. A 1  $\mu$ F to 10  $\mu$ F capacitor and 0.1  $\mu$ F bypass capacitor is recommended in order to further minimize noise from the power supply. The current consumption on the VDD pin, the short-circuit current limit, and the load current for the device are listed in the [Electrical Characteristics](#). The power supply must meet the aforementioned current requirements.

## 11 Layout

### 11.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies. As a general rule it is important to keep digital traces as far away from analog traces when possible.

The DACx0004 is often used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to keep digital noise from appearing at the output.

Due to the single ground pin of the DACx0004, all return currents, including digital and analog return currents for the DAC, must flow through a single point. Ideally, GND must be connected directly to an analog ground plane. This plane must be separate from the ground connection for the digital components until they were connected at the power-entry point of the system.

As with the GND connection, VDD should be connected to a 5 V power-supply plane or trace that is separate from the connection for digital logic until they are connected at the power-entry point. It is recommended to have an additional 1  $\mu$ F to 10  $\mu$ F capacitor and 0.1  $\mu$ F bypass capacitor. In some situations, additional bypassing may be required, such as a 100  $\mu$ F electrolytic capacitor or even a Pi filter made up of inductors and capacitors—all designed to essentially low-pass filter the 5 V supply, removing the high-frequency noise. In general it is always a good idea to maintain the digital signals away from analog signals.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

---

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

\*All dimensions are nominal

Images above are just a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

4221688/A 09/2014

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

# EXAMPLE STENCIL DESIGN

DMD0014A

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
