4 Channel, 12-Bit Sampling CMOS A/D Converter

FEATURES

- 25 μ s max SAMPLING AND CONVERSION
- SINGLE +5V SUPPLY OPERATION
- PIN-COMPATIBLE WITH 16-BIT ADS7825
- PARALLEL AND SERIAL DATA OUTPUT
- 28-PIN 0.3" PLASTIC DIP AND SOIC
- ± 0.5 LSB max INL AND DNL
- 50mW max POWER DISSIPATION
- 50 μ W POWER DOWN MODE
- ± 10 V INPUT RANGE, FOUR CHANNEL MULTIPLEXER
- CONTINUOUS CONVERSION MODE

DESCRIPTION

The ADS7824 can acquire and convert 12 bits to within ± 0.5 LSB in 25 μ s max while consuming only 50mW max. Laser-trimmed scaling resistors provide the standard industrial ± 10 V input range and channel-to-channel matching of $\pm 0.1\%$. The ADS7824 is a low-power 12-bit sampling A/D with a four channel input multiplexer, S/H, clock, reference, and a parallel/serial microprocessor interface. It can be configured in a continuous conversion mode to sequentially digitize all four channels. The 28-pin ADS7824 is available in a plastic 0.3" DIP and in a SOIC, both fully specified for operation over the industrial -40°C to $+85^{\circ}\text{C}$ range.

NOTES: (1) An asterisk (*) specifies same value as grade to the left. (2) LSB means Least Significant Bit. For the 12-bit, $\pm 10V$ input ADS7824, one LSB is 4.88mV. (3) Typical rms noise at worst case transitions and temperatures. (4) Full scale error is the worst case of -Full Scale or +Full Scale untrimmed deviation from ideal first and last code transitions, divided by the transition voltage (not divided by the full-scale range) and includes the effect of offset error. (5) All specifications in dB are referred to a full-scale $\pm 10V$ input. (6) A full scale sine wave input on one channel will be attenuated by this amount on the other channels. (7) Useable Bandwidth defined as Full-Scale input frequency at which Signal-to-(Noise+Distortion) degrades to 60dB, or 10 bits of accuracy. (8) The ADS7824 will accurately acquire any input step if given a full acquisition period after the step. (9) Recovers to specified performance after 2 x FS input overvoltage, and normal acquisitions can begin.

| Lead Temperature (soldering, 10s) | $+300^\circ\text{C}$ |
| Maximum Input Current to Any Pin | 100mA |

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PIN CONFIGURATION

PIN ASSIGNMENTS

| PIN # | NAME | I/O | DESCRIPTION |
|-------|------------------------------|-----|---|
| 1 | AGND1 | | Analog Ground. Used internally as ground reference point. |
| 2 | AIN ₀ | | Analog Input Channel 0. Full-scale input range is ±10V. |
| 3 | AIN ₁ | | Analog Input Channel 1. Full-scale input range is ±10V. |
| 4 | AIN ₂ | | Analog Input Channel 2. Full-scale input range is ±10V. |
| 5 | AIN ₃ | | Analog Input Channel 3. Full-scale input range is ±10V. |
| 6 | CAP | | Internal Reference Output Buffer. 2.2µF Tantalum to ground. |
| 7 | REF | | Reference Input/Output. Outputs +2.5V nominal. If used externally, must be buffered to maintain ADS7825 accuracy. Can also be driven by external system reference. In both cases, bypass to ground with a 2.2µF Tantalum capacitor. |
| 8 | AGND2 | | Analog Ground. |
| 9 | D7 | O | Parallel Data Bit 7 if PAR/ $\overline{\text{SER}}$ HIGH; Tri-state if PAR/ $\overline{\text{SER}}$ LOW. See Table I. |
| 10 | D6 | O | Parallel Data Bit 6 if PAR/ $\overline{\text{SER}}$ HIGH; Tri-state if PAR/ $\overline{\text{SER}}$ LOW. See Table I. |
| 11 | D5 | O | Parallel Data Bit 5 if PAR/ $\overline{\text{SER}}$ HIGH; Tri-state if PAR/ $\overline{\text{SER}}$ LOW. See Table I. |
| 12 | D4 | I/O | Parallel Data Bit 4 if PAR/ $\overline{\text{SER}}$ HIGH; if PAR/ $\overline{\text{SER}}$ LOW, a LOW level input here will transmit serial data on SDATA from the previous conversion using the internal serial clock; a HIGH input here will transmit serial data using an external serial clock input on DATACLK (D2). See Table I. |
| 13 | D3 | O | Parallel Data Bit 3 if PAR/ $\overline{\text{SER}}$ HIGH; SYNC output if PAR/ $\overline{\text{SER}}$ LOW. See Table I. |
| 14 | DGND | | Digital Ground. |
| 15 | D2 | I/O | Parallel Data Bit 2 if PAR/ $\overline{\text{SER}}$ HIGH; if PAR/ $\overline{\text{SER}}$ LOW, this will output the internal serial clock if EXT/ $\overline{\text{INT}}$ (D4) is LOW; will be an input for an external serial clock if EXT/ $\overline{\text{INT}}$ (D4) is HIGH. See Table I. |
| 16 | D1 | O | Parallel Data Bit 1 if PAR/ $\overline{\text{SER}}$ HIGH; SDATA serial data output if PAR/ $\overline{\text{SER}}$ LOW. See Table I. |
| 17 | D0 | I/O | Parallel Data Bit 0 if PAR/ $\overline{\text{SER}}$ HIGH; TAG data input if PAR/ $\overline{\text{SER}}$ LOW. See Table I. |
| 18 | A1 | I/O | Channel Address. Input if CONTC LOW, output if CONTC HIGH. See Table I. |
| 19 | A0 | I/O | Channel Address. Input if CONTC LOW, output if CONTC HIGH. See Table I. |
| 20 | PAR/ $\overline{\text{SER}}$ | I | Select Parallel or Serial Output. If HIGH, parallel data will be output on D0 thru D7. If LOW, serial data will be output on SDATA. See Table I and Figure 1. |
| 21 | BYTE | I | Byte Select. Only used with parallel data, when PAR/ $\overline{\text{SER}}$ HIGH. Determines which byte is available on D0 thru D7. Changing BYTE with $\overline{\text{CS}}$ LOW and R/ $\overline{\text{C}}$ HIGH will cause the data bus to change accordingly. LOW selects the 8 MSBs; HIGH selects the 4 LSBs, see Figures 2 and 3. |
| 22 | R/ $\overline{\text{C}}$ | I | Read/Convert Input. With $\overline{\text{CS}}$ LOW, a falling edge on R/ $\overline{\text{C}}$ puts the internal sample/hold into the hold state and starts a conversion. With $\overline{\text{CS}}$ LOW, a rising edge on R/ $\overline{\text{C}}$ enables the output data bits if PAR/ $\overline{\text{SER}}$ HIGH, or starts transmission of serial data if PAR/ $\overline{\text{SER}}$ LOW and EXT/ $\overline{\text{INT}}$ HIGH. |
| 23 | $\overline{\text{CS}}$ | I | Chip Select. Internally OR'd with R/ $\overline{\text{C}}$. With CONTC LOW and R/ $\overline{\text{C}}$ LOW, a falling edge on $\overline{\text{CS}}$ will initiate a conversion. With R/ $\overline{\text{C}}$ HIGH, a falling edge on $\overline{\text{CS}}$ will enable the output data bits if PAR/ $\overline{\text{SER}}$ HIGH, or starts transmission of serial data if PAR/ $\overline{\text{SER}}$ LOW and EXT/ $\overline{\text{INT}}$ HIGH. |
| 24 | $\overline{\text{BUSY}}$ | O | Busy Output. Falls when conversion is started; remains LOW until the conversion is completed and the data is latched into the output register. In parallel output mode, output data will be valid when $\overline{\text{BUSY}}$ rises, so that the rising edge can be used to latch the data. |
| 25 | CONTC | I | Continuous Conversion Input. If LOW, conversions will occur normally when initiated using $\overline{\text{CS}}$ and R/ $\overline{\text{C}}$; if HIGH, acquisition and conversions will take place continually, cycling through all four input channels, as long as $\overline{\text{CS}}$, R/ $\overline{\text{C}}$ and PWRD are LOW. See Table I. For serial mode only. |
| 26 | PWRD | I | Power Down Input. If HIGH, conversions are inhibited and power consumption is significantly reduced. Results from the previous conversion are maintained in the output register. In the continuous conversion mode, the multiplexer address channel is reset to channel 0. |
| 27 | V _{S2} | | Supply Input. Nominally +5V. Connect directly to pin 28. Decouple to ground with 0.1µF ceramic and 10µF Tantalum capacitors. |
| 28 | V _{S1} | | Supply Input. Nominally +5V. Connect directly to pin 27. |

TYPICAL PERFORMANCE CURVES

At $T_A = +25^\circ\text{C}$, $f_S = 40\text{kHz}$, $V_{S1} = V_{S2} = +5\text{V}$, using internal reference, unless otherwise noted.

TYPICAL PERFORMANCE CURVES (CONT)

At $T_A = +25^\circ\text{C}$, $f_S = 40\text{kHz}$, $V_{S1} = V_{S2} = +5\text{V}$, using internal reference, unless otherwise noted.

BASIC OPERATION

PARALLEL OUTPUT

Figure 1a shows a basic circuit to operate the ADS7824 with parallel output (Channel 0 selected). Taking $\overline{R/\overline{C}}$ (pin 22) LOW for 40ns (12 μ s max) will initiate a conversion. \overline{BUSY} (pin 24) will go LOW and stay LOW until the conversion is completed and the output register is updated. If BYTE (pin 21) is LOW, the 8 most significant bits will be valid when pin 24 rises; if BYTE is HIGH, the 4 least significant bits will be valid when \overline{BUSY} rises. Data will be output in Binary Two's Complement format. \overline{BUSY} going HIGH can be used to latch the data. After the first byte has been read, BYTE can be toggled allowing the remaining byte to be read. All convert commands will be ignored while \overline{BUSY} is LOW.

The ADS7824 will begin tracking the input signal at the end of the conversion. Allowing 25 μ s between convert commands assures accurate acquisition of a new signal.

SERIAL OUTPUT

Figure 1b shows a basic circuit to operate the ADS7824 with serial output (Channel 0 selected). Taking $\overline{R/\overline{C}}$ (pin 22) LOW for 40ns (12 μ s max) will initiate a conversion and output valid data from the previous conversion on SDATA (pin 16) synchronized to 12 clock pulses output on DATACLK (pin 15). \overline{BUSY} (pin 24) will go LOW and stay LOW until the conversion is completed and the serial data has been transmitted. Data will be output in Binary Two's Complement format, MSB first, and will be valid on both the rising and falling edges of the data clock. \overline{BUSY} going HIGH can be used to latch the data. All convert commands will be ignored while \overline{BUSY} is LOW.

The ADS7824 will begin tracking the input signal at the end of the conversion. Allowing 25 μ s between convert commands assures accurate acquisition of a new signal.

FIGURE 1. Basic Connection Diagram, (a) Parallel Output, (b) Serial Output.

STARTING A CONVERSION

The combination of \overline{CS} (pin 23) and $\overline{R/C}$ (pin 22) LOW for a minimum of 40ns places the sample/hold of the ADS7824 in the hold state and starts conversion 'n'. \overline{BUSY} (pin 24) will go LOW and stay LOW until conversion 'n' is completed and the internal output register has been updated. All new convert commands during \overline{BUSY} LOW will be ignored. \overline{CS} and/or $\overline{R/C}$ must go HIGH before \overline{BUSY} goes HIGH or a new conversion will be initiated without sufficient time to acquire a new signal.

The ADS7824 will begin tracking the input signal at the end of the conversion. Allowing 25 μ s between convert commands assures accurate acquisition of a new signal. Refer to Tables Ia and Ib for a summary of \overline{CS} , $\overline{R/C}$, and \overline{BUSY} states and Figures 2 through 6 and Table II for timing information. \overline{CS} and $\overline{R/C}$ are internally OR'd and level triggered. There is not a requirement which input goes LOW first when

initiating a conversion. If, however, it is critical that \overline{CS} or $\overline{R/C}$ initiates conversion 'n', be sure the less critical input is LOW at least 10ns prior to the initiating input. If $\overline{EXT/INT}$ (pin 12) is LOW when initiating conversion 'n', serial data from conversion 'n - 1' will be output on SDATA (pin 16) following the start of conversion 'n'. See Internal Data Clock in the Reading Data section.

To reduce the number of control pins, \overline{CS} can be tied LOW using $\overline{R/C}$ to control the read and convert modes. This will have no effect when using the internal data clock in the serial output mode. However, the parallel output and the serial output (only when using an external data clock) will be affected whenever $\overline{R/C}$ goes HIGH. Refer to the Reading Data section and Figures 2, 3, 5, and 6.

FIGURE 6. Conversion and Read Timing with External Clock (EXT/INT HIGH). Read During Conversion (Previous Conversion Results).

READING DATA

PARALLEL OUTPUT

To use the parallel output, tie $\overline{\text{PAR/SER}}$ (pin 20) HIGH. The parallel output will be active when $\overline{\text{R/C}}$ (pin 22) is HIGH and $\overline{\text{CS}}$ (pin 23) is LOW. Any other combination of $\overline{\text{CS}}$ and $\overline{\text{R/C}}$ will tri-state the parallel output. Valid conversion data can be read in two 8-bit bytes on D7-D0 (pins 9-13 and 15-17). When BYTE (pin 21) is LOW, the 8 most significant bits will be valid with the MSB on D7. When BYTE is HIGH, the 4 least significant bits will be valid with the LSB on D4. BYTE can be toggled to read both bytes within one conversion cycle.

Upon initial power up, the parallel output will contain indeterminate data.

PARALLEL OUTPUT (After a Conversion)

After conversion 'n' is completed and the output registers have been updated, $\overline{\text{BUSY}}$ (pin 24) will go HIGH. Valid data from conversion 'n' will be available on D7-D0 (pins 9-13 and 15-17). $\overline{\text{BUSY}}$ going HIGH can be used to latch the data. Refer to Table II and Figures 2 and 3 for timing constraints.

PARALLEL OUTPUT (During a Conversion)

After conversion 'n' has been initiated, valid data from conversion 'n - 1' can be read and will be valid up to 12 μ s

after the start of conversion 'n'. Do not attempt to read data beyond 12 μ s after the start of conversion 'n' until $\overline{\text{BUSY}}$ (pin 24) goes HIGH; this may result in reading invalid data. Refer to Table II and Figures 2 and 3 for timing constraints.

SERIAL OUTPUT

When $\overline{\text{PAR/SER}}$ (pin 20) is LOW, data can be clocked out serially with the internal data clock or an external data clock. When $\overline{\text{EXT/INT}}$ (pin 12) is LOW, $\overline{\text{DATACLK}}$ (pin 15) is an output and is always active regardless of the state of $\overline{\text{CS}}$ (pin 23) and $\overline{\text{R/C}}$ (pin 22). The $\overline{\text{SDATA}}$ output is active when $\overline{\text{BUSY}}$ (pin 24) is LOW. Otherwise, it is in a tri-state condition. When $\overline{\text{EXT/INT}}$ is HIGH, $\overline{\text{DATACLK}}$ is an input. The $\overline{\text{SDATA}}$ output is active when $\overline{\text{CS}}$ is LOW and $\overline{\text{R/C}}$ is HIGH. Otherwise, it is in a tri-state condition. Regardless of the state of $\overline{\text{EXT/INT}}$, SYNC (pin 13) is an output and always active, while TAG (pin 17) is always an input.

INTERNAL DATA CLOCK (During A Conversion)

To use the internal data clock, tie $\overline{\text{EXT/INT}}$ (pin 12) LOW. The combination of $\overline{\text{R/C}}$ (pin 22) and $\overline{\text{CS}}$ (pin 23) LOW will initiate conversion 'n' and activate the internal data clock (typically 900kHz clock rate). The ADS7824 will output 12 bits of valid data, MSB first, from conversion 'n - 1' on $\overline{\text{SDATA}}$ (pin 16), synchronized to 12 clock pulses output on $\overline{\text{DATACLK}}$ (pin 15). The data will be valid on both the

TABLE II. Conversion, Data, and Address Timing. $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$.

rising and falling edges of the internal data clock. The rising edge of $\overline{\text{BUSY}}$ (pin 24) can be used to latch the data. After the 12th clock pulse, DATACLK will remain LOW until the next conversion is initiated, while SDATA will go to whatever logic level was input on TAG (pin 17) during the first clock pulse. The SDATA output will tri-state when $\overline{\text{BUSY}}$ returns HIGH. Refer to Table II and Figure 4 for timing information.

EXTERNAL DATA CLOCK

To use an external clock, tie $\overline{\text{EXT/INT}}$ (pin 12) HIGH. The external clock is not a conversion clock; it can only be used as a data clock. To enable the output mode of the ADS7824, $\overline{\text{CS}}$ (pin 23) must be LOW and $\text{R}/\overline{\text{C}}$ (pin 22) must be HIGH. DATACLK must be HIGH for 20% to 70% of the total data clock period; the clock rate can be between DC and 10MHz. Serial data from conversion 'n' can be output on SDATA (pin 16) after conversion 'n' is completed or during conversion 'n + 1'.

An obvious way to simplify control of the converter is to tie $\overline{\text{CS}}$ LOW while using $\text{R}/\overline{\text{C}}$ to initiate conversions. While this is perfectly acceptable, there is a possible problem when using an external data clock. At an indeterminate point from 12 μs after the start of conversion 'n' until $\overline{\text{BUSY}}$ rises, the internal logic will shift the results of conversion 'n' into the output register. If $\overline{\text{CS}}$ is LOW, $\text{R}/\overline{\text{C}}$ is HIGH and the external clock is HIGH at this point, data will be lost. So, with $\overline{\text{CS}}$ LOW, either $\text{R}/\overline{\text{C}}$ and/or DATACLK must be LOW during this period to avoid losing valid data.

EXTERNAL DATA CLOCK (After a Conversion)

After conversion 'n' is completed and the output registers have been updated, $\overline{\text{BUSY}}$ (pin 24) will go HIGH. With $\overline{\text{CS}}$ LOW (pin 23) and $\text{R}/\overline{\text{C}}$ HIGH (pin 22), valid data from conversion 'n' will be output on SDATA (pin 16) synchronized to the external data clock input on DATACLK (pin 15). Between 15 and 35ns following the rising edge of the first external data clock, the SYNC output pin will go HIGH for one full data clock period (100ns minimum). The MSB will be valid between 25 and 55ns after the rising edge of the second data clock. The LSB will be valid on the 13th falling edge and the 14th rising edge of the data clock. TAG (pin 17) will input a bit of data for every external clock pulse. The first bit input on TAG will be valid on SDATA on the

14th falling edge and the 15th rising edge of DATACLK ; the second input bit will be valid on the 15th falling edge and the 16th rising edge, etc. With a continuous data clock, TAG data will be output on DATA until the internal output registers are updated with the results from the next conversion. Refer to Table II and Figure 5 for timing information.

EXTERNAL DATA CLOCK (During a Conversion)

After conversion 'n' has been initiated, valid data from conversion 'n - 1' can be read and will be valid up to 12 μs after the start of conversion 'n'. Do not attempt to clock out data from 12 μs after the start of conversion 'n' until $\overline{\text{BUSY}}$ (pin 24) rises; this will result in data loss.

NOTE: For the best possible performance when using an external data clock, data should not be clocked out during a conversion. The switching noise of the asynchronous data clock can cause digital feedthrough degrading the converter's performance. Refer to Table II and Figure 6 for timing information.

TAG FEATURE

TAG (pin 17) inputs serial data synchronized to the external or internal data clock.

When using an external data clock, the serial bit stream input on TAG will follow the LSB output on SDATA (pin 16) until the internal output register is updated with new conversion results. See Table II and Figures 5 and 6.

The logic level input on TAG for the first rising edge of the internal data clock will be valid on SDATA after all 12 bits of valid data have been output.

MULTIPLEXER TIMING

The four channel input multiplexer may be addressed manually or placed in a continuous conversion mode where all four channels are sequentially addressed.

CONTINUOUS CONVERSION MODE (CONTC= 5V)

To place the ADS7824 in the continuous conversion mode, CONTC (pin 25) must be tied HIGH. In this mode, acquisition and conversions will take place continually, cycling through all four channels as long as $\overline{\text{CS}}$, $\text{R}/\overline{\text{C}}$ and PWRD are LOW (See Table III). Whichever address was last loaded

| CONTC | $\overline{\text{CS}}$ | $\text{R}/\overline{\text{C}}$ | $\overline{\text{BUSY}}$ | PWRD | A0 and A1 | OPERATION |
|-------|------------------------|--------------------------------|--------------------------|---------------|-----------|--|
| 0 | X | X | X | X | Inputs | Initiating conversion n latches in the levels input on A0 and A1 to select the channel for conversion 'n + 1'. |
| 0 | X | X | 0 | 0 | Inputs | Conversion in process. New convert commands ignored. |
| 0 | 0 | ↓ | 1 | 0 | Inputs | Initiates conversion on channel selected at start of previous conversion. |
| 0 | ↓ | 0 | 1 | 0 | Inputs | Initiates conversion on channel selected at start of previous conversion. |
| 0 | X | X | X | 1 | Inputs | All analog functions powered down. Conversions in process or initiated will yield meaningless data. |
| 1 | X | X | X | X | Outputs | The end of conversion n (when $\overline{\text{BUSY}}$ rises) increments the internal channel latches and outputs the channel address for conversion 'n + 1' on A0 and A1. |
| 1 | X | X | 0 | 0 | Outputs | Conversion in process. |
| 1 | 0 | ↓ | 1 | 0 | Outputs | Restarts continuous conversion process on next input channel. |
| 1 | ↓ | 0 | 1 | 0 | Outputs | Restarts continuous conversion process on next input channel. |
| 1 | X | X | X | 1 | Outputs | All analog functions powered down. Conversions in process or initiated will yield meaningless data. Resets selected input channel for next conversion to AIN_0 . |

TABLE III. Conversion Control.

into the A0 and A1 registers (pins 19 and 18, respectively) prior to $\overline{\text{CONTC}}$ being raised HIGH, becomes the first address in the sequential continuous conversion mode (e.g., if Channel 1 was the last address selected then Channel 2 will follow, then Channel 3, and so on). The A0 and A1 address inputs become outputs when the device is in this mode. When $\overline{\text{BUSY}}$ rises at the end of a conversion, A0 and A1 will output the address of the channel that will be converted when $\overline{\text{BUSY}}$ goes LOW at the beginning of the next conversion. Data will be valid for the previous channel after $\overline{\text{BUSY}}$ rises. The address lines are updated when $\overline{\text{BUSY}}$ rises. See Table IVa and Figure 7 for channel selection timing in continuous conversion mode.

PWRD (pin 26) can be used to reset the multiplexer address to zero. With the ADS7824 configured for no conversion, PWRD can be taken HIGH for a minimum of 200ns. When PWRD returns LOW, the multiplexer address will be reset to zero. When the continuous conversion mode is enabled, the first conversion will be done on Channel 0. Subsequent

conversions will proceed through each higher channel, cycling back to zero after Channel 3.

If PWRD is held HIGH for a significant period of time, the REF (pin 7) bypass capacitor may discharge (if the internal reference is being utilized) and the CAP (pin 6) bypass capacitor will discharge (for both internal and external references). The continuous conversion mode should not be enabled until the bypass capacitor(s) have recharged and stabilized (1ms for 2.2 μ F capacitors recommended). In addition, the continuous conversion mode should not be enabled even with a short pulse on PWRD until the minimum acquisition time has been met.

MANUAL CHANNEL SELECTION ($\overline{\text{CONTC}} = 0\text{V}$)

The channels of the ADS7824 can be selected manually by using the A0 and A1 address pins (pins 19 and 18, respectively). See Table IVb for the multiplexer truth table and Figure 8 for channel selection timing.

ADS7824 TIMING AND CONTROL

| A1 | A0 | DATA AVAILABLE FROM CHANNEL | CHANNEL TO BE OR BEING CONVERTED | DESCRIPTION OF OPERATION |
|----|----|-----------------------------|----------------------------------|--|
| 0 | 0 | AIN ₃ | AIN ₀ | Channel being acquired or converted is output on these address lines. Data is valid for the previous channel. These lines are updated when $\overline{\text{BUSY}}$ rises. |
| 0 | 1 | AIN ₀ | AIN ₁ | |
| 1 | 0 | AIN ₁ | AIN ₂ | |
| 1 | 1 | AIN ₂ | AIN ₃ | |

FIGURE 8. Channel Addressing in Normal Conversion Mode ($\overline{\text{CONTC}}$ and $\overline{\text{CS}}$ LOW).

CALIBRATION

The ADS7824 has no internal provision for correcting the individual bipolar zero error or full-scale error for each individual channel. Instead, the bipolar zero error of each channel is guaranteed to be below a level which is quite small for a converter with a $\pm 10\text{V}$ input range (slightly more than ± 2 LSBs). In addition, the channel errors should match each other to within 1 LSB.

For the full-scale error, the circuit of Figure 9 can be used. This will allow the reference to be adjusted such that the full-scale error for any single channel can be set to zero. Again, the close matching of the channels will ensure that the full-scale errors on the other channels will be small.

FIGURE 9. Full Scale Trim.

REFERENCE

The ADS7824 can operate with its internal 2.5V reference or an external reference. By applying an external reference to pin 7, the internal reference can be bypassed.

REF

REF (pin 7) is an input for an external reference or the output for the internal 2.5V reference. A 2.2 μF capacitor should be connected as close to the REF pin as possible. This capacitor and the output resistance of REF create a low pass filter to bandlimit noise on the reference. Using a smaller value capacitor will introduce more noise to the reference degrading the SNR and SINAD. The REF pin should not be used to drive external AC or DC loads.

The range for the external reference is 2.3V to 2.7V and determines the actual LSB size. Increasing the reference voltage will increase the full scale range and the LSB size of the converter which can improve the SNR.

CAP

CAP (pin 6) is the output of the internal reference buffer. A 2.2 μF capacitor should be placed as close to the CAP pin as possible to provide optimum switching currents for the CDAC throughout the conversion cycle. This capacitor also provides compensation for the output of the buffer. Using a capacitor any smaller than 1 μF can cause the output buffer to oscillate and may not have sufficient charge for the

CDAC. Capacitor values larger than 2.2 μF will have little effect on improving performance.

The output of the buffer is capable of driving up to 1mA of current to a DC load. Using an external buffer will allow the internal reference to be used for larger DC loads and AC loads. Do not attempt to directly drive an AC load with the output voltage on CAP. This will cause performance degradation of the converter.

PWRD

PWRD (pin 26) HIGH will power down all of the analog circuitry including the reference. Data from the previous conversion will be maintained in the internal registers and can still be read. With PWRD HIGH, a convert command yields meaningless data. When PWRD is returned LOW, adequate time must be provided in order for the capacitors on REF (pin 7) and CAP (pin 6) to recharge. For 2.2 μF capacitors, a minimum recharge/settling time of 1ms is recommended before the conversion results should be considered valid.

LAYOUT

POWER

The ADS7824 uses 90% of its power for the analog circuitry, and the converter should be considered an analog component. For optimum performance, tie both power pins to the same +5V power supply and tie the analog and digital grounds together.

The +5V power for the converter should be separate from the +5V used for the system's digital logic. Connecting V_{S1} and V_{S2} (pins 28 and 27) directly to a digital supply can reduce converter performance due to switching noise from the digital logic. For best performance, the +5V supply can be produced from whatever analog supply is used for the rest of the analog signal conditioning. If +12V or +15V supplies are present, a simple +5V regulator can be used. Although it is not suggested, if the digital supply must be used to power the converter, be sure to properly filter the supply. Either using a filtered digital supply or a regulated analog supply, both V_{S1} and V_{S2} should be tied to the same +5V source.

GROUNDING

Three ground pins are present on the ADS7824. DGND is the digital supply ground. AGND2 is the analog supply ground. AGND1 is the ground which all analog signals internal to the A/D are referenced. AGND1 is more susceptible to current induced voltage drops and must have the path of least resistance back to the power supply.

All the ground pins of the A/D should be tied to an analog ground plane, separated from the system's digital logic ground, to achieve optimum performance. Both analog and digital ground planes should be tied to the 'system' ground as near to the power supplies as possible. This helps to prevent dynamic digital ground currents from modulating the analog ground through a common impedance to power ground.

CROSSTALK

With a full-scale 1kHz input signal, worst case crosstalk on the ADS7824 is better than -95dB. This should be adequate for even the most demanding applications. However, if crosstalk is a concern, the following items should be kept in mind:

The worst case crosstalk is generally from Channel 3 to 2. In addition, crosstalk from Channel 3 to any other channel is worse than from those channels to Channel 3. The reason for this is that channel three is nearer to the reference on the ADS7824. This allows two coupling modes: channel-to-channel and Channel 3 to the reference. In general, when crosstalk is a concern, avoid placing signals with higher frequency components on Channel 3.

If a particular channel should be as immune as possible from crosstalk, Channel 0 would be the best channel for the signal and Channel 1 should have the signal with the lowest frequency content. If two signals are to have as little crosstalk as possible, they should be placed on Channel 0 and Channel 2 with lower frequency, less-sensitive inputs on the other channels.

SIGNAL CONDITIONING

The FET switches used for the sample hold on many CMOS A/D converters release a significant amount of charge injection which can cause the driving op amp to oscillate. The amount of charge injection due to the sampling FET switch on the ADS7824 is approximately 5-10% of the amount on similar ADCs with the charge redistribution DAC (CDAC) architecture. There is also a resistive front end which attenuates any charge which is released. The end result is a

minimal requirement for the drive capability on the signal conditioning preceding the A/D. Any op amp sufficient for the signal in an application will be sufficient to drive the ADS7824.

The resistive front end of the ADS7824 also provides a guaranteed $\pm 15V$ overvoltage protection. In most cases, this eliminates the need for external over voltage protection circuitry.

INTERMEDIATE LATCHES

The ADS7824 does have tri-state outputs for the parallel port, but intermediate latches should be used if the bus will be active during conversions. If the bus is not active during conversions, the tri-state outputs can be used to isolate the A/D from other peripherals on the same bus.

Intermediate latches are beneficial on any monolithic A/D converter. The ADS7824 has an internal LSB size of $610\mu V$. Transients from fast switching signals on the parallel port, even when the A/D is tri-stated, can be coupled through the substrate to the analog circuitry causing degradation of converter performance. The effect of this phenomenon will be more obvious when using the pin-compatible ADS7825 or any of the other 16-bit converters in the ADS Family. This is due to the smaller LSB size of $38\mu V$.

For an ADS7824 with proper layout, grounding, and bypassing; the effect should only be a few tenths of an LSB at the most. In those cases where this is not true, it is possible for the conversion results to exhibit random errors of many LSBs. Poor grounding, poor bypassing, and high-speed digital signals will increase the magnitude of the errors.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
