

POWER MANAGEMENT PRODUCTS

COMPANY OVERVIEW

Diodes Incorporated is a leading global provider of Discrete and Analog semiconductors.

Its global footprint includes sales offices in 5 countries and manufacturing locations in China, Europe and the USA.

A focus on product innovation, cost reduction, acquisitions and customer service has made Diodes Incorporated an industry leader.

Combining leading silicon and packaging technologies, Diodes provides a broad portfolio of discrete semiconductors comprising Bipolar Transistors, MOSFETs, Schottky diodes, SBR, switching diodes and functional specific arrays to enable our customers' next generation designs.

The Diodes' Analog IC portfolio consists of 6 main areas: Power Management ICs, Standard Linear, Lighting, Sensors, Direct Broadcast by Satellite and Applications Specific Standard Products.

SOLUTIONS FOR POWER MANAGEMENT CHALLENGES

Diodes offers a well-rounded portfolio of analog and discrete components for power management solutions. The product offering includes solutions for high end consumer, communications, computing, industrial, medical, and the rapidly expanding portable applications sector.

With in-house IP, wafer fab technology, and packaging capabilities, Diodes offers an aggressive way to reduce solution size and increase feature set with cost optimization in mind. Strategic partnerships enhance product availability, providing access to optimized process technology and additional production capacity.

Our worldwide sales and technical support team enables close customer relationships and fast response time. Application notes, samples, and evaluation tools enable ready access to Diodes' products and easy design-in.

This power management selection guide includes DC-DC switching converters and controllers, LDOs, linear regulators, load switches, and USB power switches.

Diodes' offering in DC-DC non-isolated switching voltage regulators includes input voltages ranging from as low as 0.9V up to 60V. Load currents of up to 5A can be supported, with switching frequencies from 50kHz to 1.8MHz. The device topologies offered include step-down, step-up, and inverting converters and controllers.

Linear regulators are offered for the industrial market with high-input voltages ranging up to 25V and 5A, as well as low-voltage CMOS LDOs for point-of-load in portable, industrial, and consumer electronics. Ultra low dropout regulators allow core-to-core voltage regulation, for example 1.8V to 1.5V.

Single channel load switches with currents up to 2A and typical $R_{DS(ON)}$ of 80m Ω and output discharge function are available in SOT25 and 6-pin 2x1.8mm DFN packages for optimized solution size.

USB power switches are offered in industry standard pin out and packaging. Available in single and dual channel for 0.5A, 1A, 1.5A, and 2A continuous load current, Diodes' USB power switches support USB 2.0 and 3.0 standards.

Products are available in Green molding compound and are RoHS compliant.

Switching Voltage Regulators

Converters vs. Controllers

Converters feature integrated power switches to make designing with them easier and to minimize component count, while controllers using external power switches offer increased flexibility to system board designers.

Internal vs. External Compensation

Internal compensation allows for smaller board space and fewer components, while use of external compensation allows the system designer to select specific inductor and capacitor values to optimize system stability.

Switching Frequency

Higher switching frequencies will reduce the output ripple current and will allow for comparatively smaller inductors, but special attention has to be given to EMI.

With higher switching frequency, the losses in the MOSFETs will increase as they are in transition regions longer.

Protection Features

Over-current, voltage, and temperature protection will increase board reliability and prevent premature failures. A Power Good signal in combination with an Enable pin can be used for power sequencing and can warn the processor of possible supply problems and shut down in a controlled manner.

Enable Pin

An Enable pin can serve as a power saving opportunity as system blocks can be turned off and energy efficiency in stand-by can be dramatically increased.

THE DIODES ADVANTAGE

Typical Application

AP34063 Universal DC-DC Converter

- Use as Step up, Step down, or Inverter
- Operates from 3V to 40V
- Output switch current up to 1.6A
- Precise 2% reference

The AP5100 is a current mode step-down converter with a built-in power MOSFET to enable smallest size power conversion solutions.

With the low series on-resistance power switch, it enables a constant output current of up to 1.2A over a wide input supply range. The load and line regulation has excellent response time over the operating input voltage and temperature range.

The AP5100 is self-protected through a cycle-by-cycle current limiting algorithm and on-chip thermal protection.

The AP5100 will provide voltage conversion with low component count using widely available standard external components. The AP5100 is available in a SOT26 package.

USB Current-Limiting Switches

These integrated high-side power switches are optimized for Universal Serial Bus (USB) and other 3V-5V hot-swap applications. They provide fault protection, power sequencing, and segmentation for different modules.

The family of devices complies with USB 2.0 or 3.0 standards, and is available with both polarities of Enable input.

Key features

- Accurate current limiting
- Reverse current blocking
- Built-in Soft-Start
- Fast over-current response
- Under-voltage lockout (UVLO)
- Open-drain error flag output with deglitch
- Short-Circuit protection
- Thermal protection
- UL Recognized and IEC 60950-1 CB Scheme Certified

AP2101/AP2111 2A USB Power Switch

THE DIODES ADVANTAGE

The Diodes Advantage

The AP2101/AP2111 provides a simple cost-effective solution for multiple USB port protection

- **2A single channel in SO-8 and MSOP-8-EP**
Expands AP21x1 single channel series (0.5A/1A/1.5A) for high current applications
- **5µs fast transient response time**
Prevents system shutdown/restart and improves system robustness
- **Output discharge function**
Provides controlled discharge of the output voltage stored on the output capacitor
- **2.5A accurate current limiting**
Reduces power requirements on system rail and reduces system cost
- **Reverse current blocking, over-current, short-circuit, and over-temperature protection**
Improves robustness of USB port(s)
- **UL recognized and IEC 60950-1 CB Scheme certified**
Ensures system safety and improves product quality

Load Switches

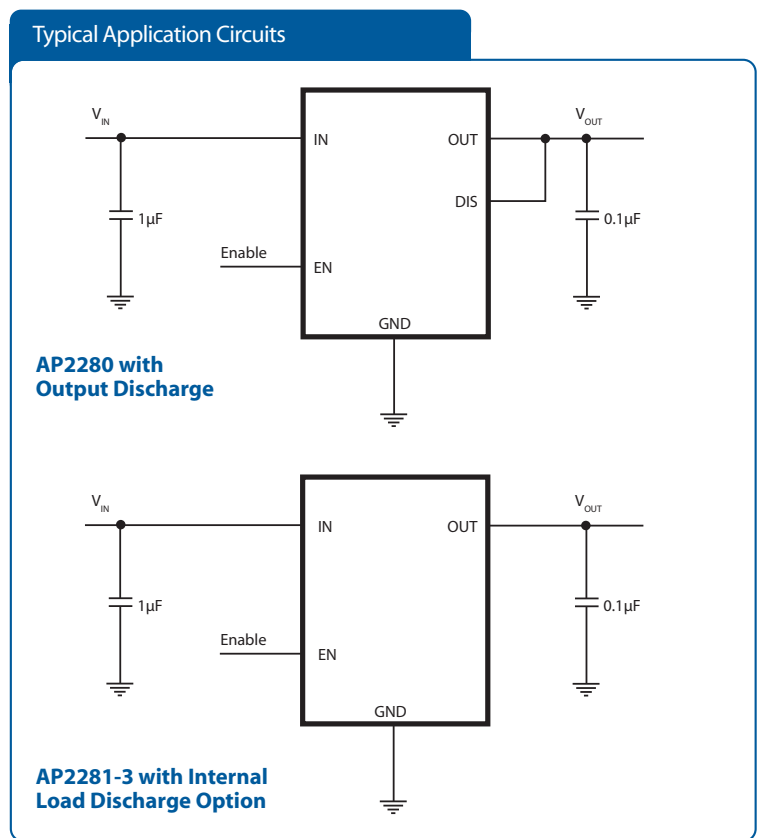

Slew rate controlled load switches consist of a single P-channel MOSFET power switch designed for high-side load switching or power distribution applications. The MOSFET has a typical $R_{DS(ON)}$ of 80m Ω at 5V, allowing increased load current handling capability with a low forward voltage drop.

The turn-on slew rate of the device is controlled internally to reduce turn-on inrush current and improves system performance and reliability with minimized power-on transients.

Diodes' load switches are ideal for 1.8V, 2.5V, 3.3V, and 5V applications, and for battery powered distribution systems where power consumption is a concern.

Key features

- Wide input range: 1.5V to 6V
- Low $R_{DS(ON)}$: 80m Ω typical @5V
- Very low quiescent current
- 100 μ s or 1ms controlled turn-on rise time
- Discharge function
- Low profile DFN2018-6 package
- Temperature range: -45 $^{\circ}$ C to 85 $^{\circ}$ C

Linear and Low Dropout (LDO) Regulators

A broad LDO portfolio is offered to cover a wide range of specifications and performance for consumer, computing, communications, portable, and industrial applications.

The characteristics of low dropout voltage and low quiescent current provide great power savings in portable and low power applications.

Most LDOs are designed to drive low ESR MLCC capacitors to reduce system-level manufacturing cost and improve control loop stability and transient response.

The fast transient response and start-up time help load circuitry move in and out of standby mode in real time and extend battery life. It also provides stable voltage regulation for fast DSPs and FPGAs with fast changing loads.

Built-in current-limit, short-circuit, and thermal protections prevent damage to ICs in fault or extreme operating conditions.

Key Features

- Wide input voltage range
- Output voltage: adjustable or fixed options
- Compatible with low ESR ceramic capacitors
- Temperature range: -45°C to 85°C
- Current-limit protection
- Short-circuit protection
- Thermal protection
- Green and RoHS compliant packages

THE DIODES ADVANTAGE

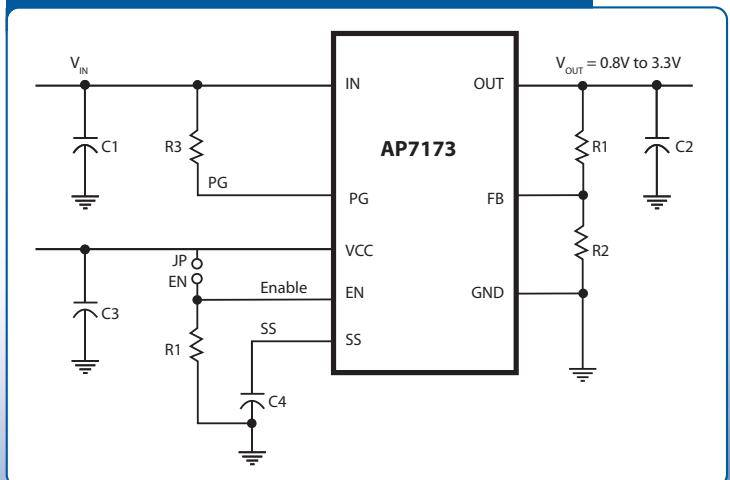

High Current LDO with Programmable Soft Start

The AP7173 is a 1.5A LDO that features a user-programmable soft-start, an enable input, and a power-good output.

The soft-start reduces inrush current of the load capacitors and minimizes stress on the input power source during start-up. The enable input and power-good output allow users to configure power management solutions that can meet the sequencing requirements of FPGAs, DSPs, and other applications with different start-up and power-down requirements.

The AP7173 is stable with any type of output capacitor of 2.2µF or more. A precision reference and feedback control deliver 2% accuracy over load, line, and operating temperature ranges. The AP7173 is available in both DFN3030-10 and SOP-8L-EP packages.

AP7173 typical application circuit (adjustable output)

Low Dropout (LDO) Regulators

Part Number	Output Current		Max Dropout Voltage	Operating Input Voltage	Quiescent Current (typ)	Output Options		Output Accuracy	Load Regulation	Line Regulation	Current Limit (typ)	PSRR (typ)	Temperature Coefficient	Operating Ambient Temp Range	Features			Pin Count	Available Packages
