# OPAx316 10-MHz, Low-Power, Low-Noise, RRIO, 1.8-V CMOS Operational Amplifier 

## 1 Features

- Unity-Gain Bandwidth: 10 MHz
- Low $\mathrm{I}_{\mathrm{Q}}: 400 \mu \mathrm{~A} / \mathrm{ch}$
- Wide Supply Range: 1.8 V to 5.5 V
- Low Noise: $11 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ at 1 kHz
- Low Input Bias Current: $\pm 5 \mathrm{pA}$
- Offset Voltage: $\pm 0.5 \mathrm{mV}$
- Unity-Gain Stable
- Internal RFI-EMI Filter
- Shutdown Version: OPA2316S
- Extended Temperature Range: $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$

## 2 Applications

- Battery-Powered Instruments:
- Consumer, Industrial, Medical
- Notebooks, Portable Media Players
- Sensor Signal Conditioning
- Automotive Applications
- Barcode Scanners
- Active Filters
- Audio

## 3 Description

The OPAx316 family of single, dual, and quad operational amplifiers represents a new generation of general-purpose, low-power operational amplifiers. Featuring rail-to-rail input and output swings, low quiescent current ( $400 \mu \mathrm{~A} / \mathrm{ch}$ typical) combined with a wide bandwidth of 10 MHz and very-low noise ( $11 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ at 1 kHz ) makes this family attractive for a variety of applications that require a good balance between cost and performance. The low input bias current supports those operational amplifiers to be used in applications with $M \Omega$ source impedances.
The robust design of the OPA×316 provide ease-ofuse to the circuit designer-a unity-gain stable, integrated RFI-EMI rejection filter, no phase reversal in overdrive condition, and high electrostatic discharge (ESD) protection (4-kV HBM).
These devices are optimized for low-voltage operation as low as $1.8 \mathrm{~V}( \pm 0.9 \mathrm{~V})$ and up to 5.5 V $( \pm 2.75 \mathrm{~V})$. This latest addition of low-voltage CMOS operational amplifiers, in conjunction with the OPAx313 and OPA×314 provide a family of bandwidth, noise, and power options to meet the needs of a wide variety of applications.

| Device Information ${ }^{(1)}$ |  |  |
| :---: | :---: | :---: |
| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
| OPA316 | SC-70 (5) | $1.25 \mathrm{~mm} \times 2.00 \mathrm{~mm}$ |
|  | SOT-23 (5) | $1.60 \mathrm{~mm} \times 2.90 \mathrm{~mm}$ |
| OPA2316 | DFN (8) | $3.00 \mathrm{~mm} \times 3.00 \mathrm{~mm}$ |
|  | MSOP, VSSOP (8) | $3.00 \mathrm{~mm} \times 3.00 \mathrm{~mm}$ |
|  | SOIC (8) | $3.91 \mathrm{~mm} \times 4.90 \mathrm{~mm}$ |
| OPA2316S | MSOP, VSSOP (10) | $3.00 \mathrm{~mm} \times 3.00 \mathrm{~mm}$ |
|  | X2QFN (10) | $1.50 \mathrm{~mm} \times 2.00 \mathrm{~mm}$ |
| OPA4316 | TSSOP (14) | $4.40 \mathrm{~mm} \times 5.00 \mathrm{~mm}$ |
|  | SOIC (14) | $8.65 \mathrm{~mm} \times 3.91 \mathrm{~mm}$ |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Low-Supply Current ( $400 \mu \mathrm{~A} / \mathrm{ch}$ ) for $10-\mathrm{MHz}$ Bandwidth

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.
Changes from Revision E (May 2016) to Revision F Page

- Added SOIC (14) / OPA4316 body size information to Device Information table ..... 1
- Added D package to PW package pinout drawing ..... 4
- Added D (SOIC) thermal information to Thermal Information: OPA4316 table ..... 8
Changes from Revision D (December 2014) to Revision E Page
- Added new "RUG" package ..... 1
Changes from Revision C (October 2014) to Revision D Page
- Added Shutdown section to Electrical Characteristics table ..... 10
- Added Related Documentation section ..... 27
Changes from Revision B (August 2014) to Revision C- Updated devices and packages in Device Information table1
- Added thermal information for OPA2316S and OPA4316 ..... 7
Changes from Revision A (April 2014) to Revision B ..... Page
- Added OPA2316 to the Device Information table ..... 1
- Added thermal information for OPA2316 ..... 7
- Added channel separation to Electrical Characteristics ..... 9
- Added GBP instead of UGB in the Electrical Characteristics ..... 9
- Added Channel Separation vs Frequency plot ..... 16
Changes from Original (April 2014) to Revision A Page
- Changed status from preview to production ..... 1

## 5 Pin Configuration and Functions

DBV Package 5-Pin SOT-23 Top View

Pitch: 0.5 mm .
Connect thermal pad to $\mathrm{V}-$. Pad size: $2.00 \mathrm{~mm} \times 1.20 \mathrm{~mm}$.

## Pin Functions

| PIN |  |  |  |  |  |  |  | DESCRIPTION |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| NAME | OPA316 |  | OPA2316 | OPA2316S |  | OPA4316 |  |  |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature (unless otherwise noted) ${ }^{(1)}$

|  |  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage |  |  |  | 7 | V |
|  | Voltage ${ }^{(2)}$ | Common-mode | (V-) - 0.5 | $(\mathrm{V}+)^{+} 0.5$ | V |
| Signal input pins |  | Differential |  | $(\mathrm{V}+)-(\mathrm{V}-)+0.2$ | V |
|  | Current ${ }^{(2)}$ |  | -10 | 10 | mA |
| Output short-circu |  |  |  | ntinuous |  |
| $\mathrm{T}_{\mathrm{A}}$ | Operating | erature | -55 | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{J}$ | Junction te | ature |  | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage te | ature | -65 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Input pins are diode-clamped to the power-supply rails. Current limit input signals that can swing more than 0.5 V beyond the supply rails to 10 mA or less.
(3) Short-circuit to ground, one amplifier per package.

### 6.2 ESD Ratings

over operating free-air temperature range (unless otherwise noted).

|  |  |  | VALUE | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $V_{\text {(ESD) }}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)}$ | $\pm 4000$ | V |
|  |  | Charged device model (CDM), per JEDEC specification JESD22-C101 ${ }^{(2)}$ | $\pm 1500$ |  |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted).

|  |  | MIN | MAX |
| :--- | :--- | :---: | :---: |
| $V_{S}$ | Uupply voltage | 1.8 | 5.5 |
|  | Upecified temperature | V |  |

### 6.4 Thermal Information: OPA316

| THERMAL METRIC ${ }^{(1)}$ |  | OPA316 |  | UNIT |
| :---: | :---: | :---: | :---: | :---: |
|  |  | DBV (SOT23) | DCK (SC70) |  |
|  |  | 5 PINS | 5 PINS |  |
| $\mathrm{R}_{\text {өJA }}$ | Junction-to-ambient thermal resistance ${ }^{(2)}$ | 221.7 | 263.3 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(top) }}$ | Junction-to-case(top) thermal resistance ${ }^{(3)}$ | 144.7 | 75.5 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJB }}$ | Junction-to-board thermal resistance ${ }^{(4)}$ | 49.7 | 51 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{\mathrm{JT}}$ | Junction-to-top characterization parameter ${ }^{(5)}$ | 26.1 | 1 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{J B}$ | Junction-to-board characterization parameter ${ }^{(6)}$ | 49 | 50.3 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

(1) For more information about traditional and new thermal metrics, see Semiconductor and IC Package Thermal Metrics (SPRA953).
(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDECstandard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
(5) The junction-to-top characterization parameter, $\psi_{J T}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $\mathrm{R}_{\text {өJA }}$, using a procedure described in JESD51-2a (sections 6 and 7).
(6) The junction-to-board characterization parameter, $\psi_{\mathrm{JB}}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $\mathrm{R}_{\text {өJA }}$, using a procedure described in JESD51-2a (sections 6 and 7).

## Thermal Information: OPA316 (continued)

| THERMAL METRIC ${ }^{(1)}$ |  | OPA316 |  | UNIT |
| :---: | :---: | :---: | :---: | :---: |
|  |  | DBV (SOT23) | DCK (SC70) |  |
|  |  | 5 PINS | 5 PINS |  |
| $\mathrm{R}_{\text {өJC(bot) }}$ | Junction-to-case(bottom) thermal resistance ${ }^{(7)}$ | N/A | N/A | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

### 6.5 Thermal Information: OPA2316

| THERMAL METRIC ${ }^{(1)}$ |  | OPA2316 |  |  | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | D (SO) | DGK (MSOP) | DRG (DFN) |  |
|  |  | 8 PINS | 8 PINS | 8 PINS |  |
| $\mathrm{R}_{\text {日JA }}$ | Junction-to-ambient thermal resistance ${ }^{(2)}$ | 127.2 | 186.6 | 56.3 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(top) }}$ | Junction-to-case(top) thermal resistance ${ }^{(3)}$ | 71.6 | 78.8 | 72.2 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJB }}$ | Junction-to-board thermal resistance ${ }^{(4)}$ | 68.2 | 107.9 | 31 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{J T}$ | Junction-to-top characterization parameter ${ }^{(5)}$ | 22 | 15.5 | 2.3 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{\text {JB }}$ | Junction-to-board characterization parameter ${ }^{(6)}$ | 67.6 | 106.3 | 21.2 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {日JC(bot) }}$ | Junction-to-case(bottom) thermal resistance ${ }^{(7)}$ | N/A | N/A | 10.9 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

(1) For more information about traditional and new thermal metrics, see Semiconductor and IC Package Thermal Metrics (SPRA953).
(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDECstandard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
(5) The junction-to-top characterization parameter, $\psi_{\boldsymbol{J} \boldsymbol{T}}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta J A}$, using a procedure described in JESD51-2a (sections 6 and 7).
(6) The junction-to-board characterization parameter, $\psi_{\mathrm{JB}}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta J A}$, using a procedure described in JESD51-2a (sections 6 and 7).
(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

### 6.6 Thermal Information: OPA2316S

| THERMAL METRIC ${ }^{(1)}$ |  | OPA2316S |  | UNIT |
| :---: | :---: | :---: | :---: | :---: |
|  |  | DGS (MSOP) | QFN (RUG) |  |
|  |  | 10 PINS | 10 PINS |  |
| $\mathrm{R}_{\text {өJA }}$ | Junction-to-ambient thermal resistance ${ }^{(2)}$ | 189.6 | 158 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(top) }}$ | Junction-to-case(top) thermal resistance ${ }^{(3)}$ | 73.9 | 52 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJB }}$ | Junction-to-board thermal resistance ${ }^{(4)}$ | 110.7 | 88 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{\text {JT }}$ | Junction-to-top characterization parameter ${ }^{(5)}$ | 13.4 | 1 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{\text {JB }}$ | Junction-to-board characterization parameter ${ }^{(6)}$ | 109.1 | 87 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(bot) }}$ | Junction-to-case(bottom) thermal resistance ${ }^{(7)}$ | N/A | N/A | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

(1) For more information about traditional and new thermal metrics, see Semiconductor and IC Package Thermal Metrics (SPRA953).
(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDECstandard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
(5) The junction-to-top characterization parameter, $\psi \boldsymbol{J}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta J A}$, using a procedure described in JESD51-2a (sections 6 and 7).
(6) The junction-to-board characterization parameter, $\psi_{\mathrm{JB}}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta J A}$, using a procedure described in JESD51-2a (sections 6 and 7).
(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

### 6.7 Thermal Information: OPA4316

| THERMAL METRIC ${ }^{(1)}$ |  | OPA4316 |  | UNIT |
| :---: | :---: | :---: | :---: | :---: |
|  |  | PW (TSSOP) | D (SOIC) |  |
|  |  | 14 PINS | 14 PINS |  |
| $\mathrm{R}_{\text {日JA }}$ | Junction-to-ambient thermal resistance ${ }^{(2)}$ | 117.2 | 87.0 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(top) }}$ | Junction-to-case(top) thermal resistance ${ }^{(3)}$ | 46.2 | 44.4 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJB }}$ | Junction-to-board thermal resistance ${ }^{(4)}$ | 58.9 | 41.7 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{\text {JT }}$ | Junction-to-top characterization parameter ${ }^{(5)}$ | 4.9 | 11.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{\text {JB }}$ | Junction-to-board characterization parameter ${ }^{(6)}$ | 58.3 | 41.4 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(bot) }}$ | Junction-to-case(bottom) thermal resistance ${ }^{(7)}$ | N/A | N/A | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

(1) For more information about traditional and new thermal metrics, see Semiconductor and IC Package Thermal Metrics (SPRA953).
(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDECstandard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
(5) The junction-to-top characterization parameter, $\psi_{J T}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $\mathrm{R}_{\theta \mathrm{JA}}$, using a procedure described in JESD51-2a (sections 6 and 7).
(6) The junction-to-board characterization parameter, $\psi_{J B}$, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $\mathrm{R}_{\theta \mathrm{JA}}$, using a procedure described in JESD51-2a (sections 6 and 7).
(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

## 7 Detailed Description

### 7.1 Overview

The OPA316 is a family of low-power, rail-to-rail input and output operational amplifiers. These devices operate from 1.8 V to 5.5 V , are unity-gain stable, and are suitable for a wide range of general-purpose applications. The class $A B$ output stage is capable of driving less than or equal to $10-k \Omega$ loads connected to any point between $V_{+}$ and ground. The input common-mode voltage range includes both rails and allows the OPA316 series to be used in virtually any single-supply application. Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications, and makes them ideal for driving sampling analog-to-digital converters (ADCs).
The OPA316 family features $10-\mathrm{MHz}$ bandwidth and $6-\mathrm{V} / \mu$ s slew rate with only $400-\mu \mathrm{A}$ supply current per channel, providing good ac performance at very-low power consumption. DC applications are well served with a very-low input noise voltage of $11 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ at 1 kHz , low input bias current ( 5 pA ), and an input offset voltage of 0.5 mV (typical).

### 7.2 Functional Block Diagram

### 7.3 Feature Description

### 7.3.1 Operating Voltage

The OPA×316 operational amplifiers are fully specified and ensured for operation from 1.8 V to 5.5 V . In addition, many specifications apply from $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$. Parameters that vary significantly with operating voltages or temperature are illustrated in the Typical Characteristics graphs.

### 7.3.2 Rail-to-Rail Input

The input common-mode voltage range of the OPAx316 series extends 200 mV beyond the supply rails for supply voltages greater than 2.5 V . This performance is achieved with a complementary input stage: an N channel input differential pair in parallel with a P-channel differential pair, as shown in the Functional Block Diagram. The N -channel pair is active for input voltages close to the positive rail, typically ( $\mathrm{V}+$ ) -1.4 V to 200 mV above the positive supply, whereas the P-channel pair is active for inputs from 200 mV below the negative

## Feature Description (continued)

supply to approximately $\left(\mathrm{V}_{+}\right)-1.4 \mathrm{~V}$. There is a small transition region, typically $\left(\mathrm{V}_{+}\right)-1.2 \mathrm{~V}$ to $\left(\mathrm{V}_{+}\right)-1 \mathrm{~V}$, in which both pairs are on. This $200-\mathrm{mV}$ transition region can vary up to 200 mV with process variation. Thus, the transition region (both stages on) can range from $\left(\mathrm{V}_{+}\right)-1.4 \mathrm{~V}$ to $(\mathrm{V}+)-1.2 \mathrm{~V}$ on the low end, up to $(\mathrm{V}+)-1 \mathrm{~V}$ to $(\mathrm{V}+)-0.8 \mathrm{~V}$ on the high end. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD can be degraded compared to device operation outside this region.

### 7.3.3 Input and ESD Protection

The OPA×316 incorporates internal ESD protection circuits on all pins. In the case of input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. These ESD protection diodes provide in-circuit, input overdrive protection, as long as the current is limited to 10 mA as stated in Absolute Maximum Ratings. Figure 37 shows how a series input resistor can be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

Figure 37. Input Current Protection

### 7.3.4 Common-Mode Rejection Ratio (CMRR)

CMRR for the OPA×316 is specified in several ways so the user can select the best match for a given application, as shown in Electrical Characteristics. First, the data sheet gives the CMRR of the device in the common-mode range below the transition region $\left[\mathrm{V}_{\mathrm{CM}}<(\mathrm{V}+)-1.4 \mathrm{~V}\right]$. This specification is the best indicator of device capability when the application requires use of one of the differential input pairs. Second, the CMRR over the entire common-mode range is specified at $\mathrm{V}_{\mathrm{CM}}=-0.2 \mathrm{~V}$ to 5.7 V for $\mathrm{V}_{\mathrm{S}}=5.5 \mathrm{~V}$. This last value includes the variations shown in Figure 4 through the transition region.

### 7.3.5 EMI Susceptibility and Input Filtering

Operational amplifiers vary with regard to the susceptibility of the device to electromagnetic interference (EMI). If conducted EMI enters the operational amplifier, the dc offset observed at the amplifier output can shift from its nominal value when EMI is present. This shift is a result of signal rectification associated with the internal semiconductor junctions. Although all operational amplifier pin functions can be affected by EMI, the signal input pins are likely to be the most susceptible. The OPA316 operational amplifier family incorporates an internal input low-pass filter that reduces the amplifier response to EMI. This filter provides both common-mode and differential-mode filtering. The filter is designed for a cutoff frequency of approximately $80 \mathrm{MHz}(-3 \mathrm{~dB})$, with a roll-off of 20 dB per decade.
TI developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10 MHz to 6 GHz . The EMI rejection ratio (EMIRR) metric allows operational amplifiers to be directly compared by the EMI immunity. Figure 35 illustrates the results of this testing on the OPA316 series. For more information, see EMI Rejection Ratio of Operational Amplifiers (SBOA128).

### 7.3.6 Rail-to-Rail Output

Designed as a low-power, low-noise operational amplifier, the OPAx316 delivers a robust output drive capability. A class $A B$ output stage with common-source transistors is used to achieve full rail-to-rail output swing capability. For resistive loads of $10-\mathrm{k} \Omega$, the output swings typically to within 30 mV of either supply rail regardless of the power-supply voltage applied. Different load conditions change the ability of the amplifier to swing close to the rails; see the typical characteristic graph Output Voltage Swing vs Output Current (Figure 11).

## Feature Description (continued)

### 7.3.7 Capacitive Load and Stability

The OPA×316 is designed to be used in applications where driving a capacitive load is required. As with all operational amplifiers, there may be specific instances where the OPA×316 can become unstable. The particular operational amplifier circuit configuration, layout, gain, and output loading are some of the factors to consider when establishing whether or not an amplifier is stable in operation. An operational amplifier in the unity-gain $(+1 \mathrm{~V} / \mathrm{V})$ buffer configuration that drives a capacitive load exhibits a greater tendency to be unstable than an amplifier operated at a higher noise gain. The capacitive load, in conjunction with the operational amplifier output resistance, creates a pole within the feedback loop that degrades the phase margin. The degradation of the phase margin increases as the capacitive loading increases. As a conservative best practice, designing for $25 \%$ overshoot ( $40^{\circ}$ phase margin) provides improved stability over process variations. The equivalent series resistance (ESR) of some very-large capacitors ( $C_{L}$ greater than $1 \mu \mathrm{~F}$ ) is sufficient to alter the phase characteristics in the feedback loop such that the amplifier remains stable. Increasing the amplifier closed-loop gain allows the amplifier to drive increasingly larger capacitance. This increased capability is evident when observing the overshoot response of the amplifier at higher voltage gains. See the typical characteristic graphs, Small-Signal Overshoot vs Capacitive Load (Figure 24, G = -1 V/V) and Small-Signal Overshoot vs Capacitive Load (Figure 25, G = +1 V/V).
One technique for increasing the capacitive load drive capability of the amplifier operating in a unity-gain configuration is to insert a small resistor (typically $10 \Omega$ to $20 \Omega$ ) in series with the output, as shown in Figure 38. This resistor significantly reduces the overshoot and ringing associated with large capacitive loads. One possible problem with this technique, however, is that a voltage divider is created with the added series resistor and any resistor connected in parallel with the capacitive load. The voltage divider introduces a gain error at the output that reduces the output swing.

Figure 38. Improving Capacitive Load Drive

### 7.3.8 Overload Recovery

Overload recovery is defined as the time required for the operational amplifier output to recover from a saturated state to a linear state. The output devices of the operational amplifier enter a saturation region when the output voltage exceeds the rated operating voltage, either because of the high input voltage or the high gain. After the device enters the saturation region, the charge carriers in the output devices require time to return back to the linear state. After the charge carriers return back to the linear state, the device begins to slew at the specified slew rate. Thus, the propagation delay in case of an overload condition is the sum of the overload recovery time and the slew time. The overload recovery time for the OPAx316 is approximately 300 ns .

### 7.3.9 DFN Package

The OPA2316 (dual version) device uses the DFN style package (also known as SON); this package is a QFN with contacts on only two sides of the package bottom. This leadless package maximizes printed circuit board (PCB) space and offers enhanced thermal and electrical characteristics through an exposed pad. One of the primary advantages of the DFN package is the low, $0.9-\mathrm{mm}$ height. DFN packages are physically small, have a smaller routing area, improved thermal performance, reduced electrical parasitics, and use a pinout scheme that is consistent with other commonly-used packages, such as SOIC and MSOP). Additionally, the absence of external leads eliminates bent-lead issues.
The DFN package can be simply mounted using standard PCB assembly techniques. See QFN/SON PCB Attachment (SLUA271), and Quad Flatpack No-Lead Logic Packages (SCBA017).

## Feature Description (continued)

## NOTE

Connect the exposed lead frame die pad on the bottom of the DFN package to the most negative potential (V-).

### 7.4 Device Functional Modes

The OPA316, OPA2316, and OPA4316 devices are powered on when the supply is connected. The devices can be operated as a single-supply operational amplifier or a dual-supply amplifier, depending on the application.
The OPA2316S device has a SHDN (enable) pin function referenced to the negative supply voltage of the operational amplifier. A logic level high enables the operational amplifier. A valid logic high is defined as voltage $[(\mathrm{V}+)-0.1 \mathrm{~V}]$, up to $(\mathrm{V}+)$, applied to the SHDN pin. A valid logic low is defined as $[(\mathrm{V}-)+0.1 \mathrm{~V}]$, down to $(\mathrm{V}-)$, applied to the enable pin. The maximum allowed voltage applied to SHDN is 5.5 V with respect to the negative supply, independent of the positive supply voltage. Connect this pin to a valid high or a low voltage or driven, but not left as an open circuit.
The logic input is a high-impedance CMOS input. Both inputs are independently controlled. For battery-operated applications, this feature can be used to greatly reduce the average current and extend battery life.

## 8 Application and Implementation

## NOTE

Information in the following applications sections is not part of the Tl component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

### 8.1.1 General Configurations

When receiving low-level signals, the device often requires limiting the bandwidth of the incoming signals into the system. The simplest way to establish this limited bandwidth is to place an RC filter at the noninverting pin of the amplifier, as Figure 39 shows.

$$
\frac{V_{\text {OUT }}}{V_{\text {IN }}}=\left(1+\frac{\mathrm{R}_{\mathrm{F}}}{\mathrm{R}_{\mathrm{G}}}\right)\left(\frac{1}{1+\mathrm{sR}_{1} \mathrm{C}_{1}}\right)
$$

Figure 39. Single-Pole Low-Pass Filter

If even more attenuation is needed, the device requires a multiple-pole filter. The Sallen-Key filter can be used for this task, as Figure 40 shows. For best results, the amplifier must have a bandwidth that is 8 to 10 times the filter frequency bandwidth. Failure to follow this guideline can result in phase shift of the amplifier.

$$
\mathrm{R}_{1}=\mathrm{R}_{2}=\mathrm{R}
$$

$$
\mathrm{C}_{1}=\mathrm{C}_{2}=\mathrm{C}
$$

$$
Q=\text { Peaking factor }
$$

$$
\text { (Butterworth } \mathrm{Q}=0.707 \text { ) }
$$

$$
f_{-3 d B}=\frac{1}{2 \pi R C}
$$

$$
R_{G}=\frac{R_{F}}{\left(2-\frac{1}{Q}\right)}
$$

Figure 40. Two-Pole, Low-Pass, Sallen-Key Filter

### 8.2 Typical Application

Some applications require differential signals. Figure 41 shows a simple circuit to convert a single-ended input of 0.1 V to 2.4 V into a differential output of $\pm 2.3 \mathrm{~V}$ on a single $2.7-\mathrm{V}$ supply. The output range is intentionally limited to maximize linearity. The circuit is composed of two amplifiers. One amplifier functions as a buffer and creates a voltage, VOUT+. The second amplifier inverts the input and adds a reference voltage to generate VOUT-. VOUT+ and VOUT- range from 0.1 V to 2.4 V . The difference, VDIFF, is the difference between VOUT+ and VOUT- which makes the differential output voltage range 2.3 V .

Figure 41. Schematic for a Single-Ended Input to Differential Output Conversion

### 8.2.1 Design Requirements

Table 1 lists the design requirements:
Table 1. Design Parameters

| DESIGN PARAMETER | VALUE |
| :---: | :---: |
| Supply voltage | 2.7 V |
| Reference voltage | 2.5 V |
| Input voltage | 0.1 V to 2.4 V |
| Output differential voltage | $\pm 2.3 \mathrm{~V}$ |
| Output common-mode voltage | 1.25 V |
| Small-signal bandwidth | 5 MHz |

### 8.2.2 Detailed Design Procedure

The circuit in Figure 41 takes a single-ended input signal, VIN, and generates two output signals, VOUT+ and VOUT- using two amplifiers and a reference voltage, VREF. VOUT+ is the output of the first amplifier and is a buffered version of the input signal, VIN (as shown in Equation 1). VOUT- is the output of the second amplifier which uses VREF to add an offset voltage to VIN and feedback to add inverting gain. The transfer function for VOUT- is given in Equation 2.
Vout + Vin
$V_{\text {out }}=V_{\text {ref }} \times\left(\frac{R_{4}}{R_{3}+R_{4}}\right) \times\left(1+\frac{R_{2}}{R_{1}}\right)-V_{\text {in }} \times \frac{R_{2}}{R_{1}}$
The differential output signal, VDIFF, is the difference between the two single-ended output signals, VOUT+ and VOUT-. Equation 3 shows the transfer function for VDIFF. Using conditions in Equation 4 and Equation 5 and applying the conditions that $\mathrm{R}_{1}=\mathrm{R}_{2}$ and $\mathrm{R}_{3}=\mathrm{R}_{4}$, the transfer function is simplified into Equation 6. Using this configuration, the maximum input signal is equal to the reference voltage, and the maximum output of each amplifier is equal to VREF. The differential output range is $2 \times$ VREF. Furthermore, the common-mode voltage is one half of VREF, as shown in Equation 7.
$V_{\text {diff }}=V_{\text {out }}+-V_{\text {out }}=V_{\text {in }} \times\left(1+\frac{R_{2}}{R_{1}}\right)-V_{\text {ref }} \times\left(\frac{R_{4}}{R_{3}+R_{4}}\right) \times\left(1+\frac{R_{2}}{R_{1}}\right)$
Vout $+=$ Vin
Vout- $=V_{\text {ref }}-V_{\text {in }}$
$V_{\text {diff }}=2 \times V_{\text {in }}-V_{\text {ref }}$
$V_{\mathrm{cm}}=\left(\frac{\mathrm{V}_{\text {out }}+\mathrm{V}_{\text {out }-}}{2}\right)=\frac{1}{2} \mathrm{~V}_{\text {ref }}$

### 8.2.2.1 Amplifier Selection

Linearity over the input range is key for good dc accuracy. The common-mode input range and output swing limitations determine the linearity. In general, an amplifier with rail-to-rail input and output swing is required. Bandwidth is a key concern for this design, so the OPAx316 is selected because the bandwidth is greater than the target of 5 MHz . The bandwidth and power ratio makes this device power efficient and the low offset and drift ensure good accuracy for moderate precision applications.

### 8.2.2.2 Passive Component Selection

Because the transfer function of VOUT- is heavily reliant on resistors $\left(R_{1}, R_{2}, R_{3}\right.$, and $\left.R_{4}\right)$, use resistors with low tolerances to maximize performance and minimize error. This design uses resistors with resistance values of $49.9 \mathrm{k} \Omega$ and tolerances of $0.1 \%$. However, if the noise of the system is a key parameter, smaller resistance values ( $6 \mathrm{k} \Omega$ or lower) can be selected to keep the overall system noise low. This ensures that the noise from the resistors is lower than the amplifier noise.

### 8.2.3 Application Curves

The measured transfer functions in Figure 42, Figure 43, and Figure 44 are generated by sweeping the input voltage from 0.1 V to 2.4 V . The full input range is actually 0 V to 2.5 V , but is restricted by 0.1 V to maintain optimal linearity. For more details on this design and other alternative devices that can be used in place of the OPAx316, see (Single-Ended Input to Differential Output Conversion Circuit Reference Design (TIPD131).

Figure 43. VOUT- vs Input Voltage

Figure 44. VDIFF vs Input Voltage

## 9 Power Supply Recommendations

The OPAx316 is specified for operation from 1.8 V to $5.5 \mathrm{~V}( \pm 0.9 \mathrm{~V}$ to $\pm 2.75 \mathrm{~V})$; many specifications apply from $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$. Typical Characteristics presents parameters that can exhibit significant variance with regard to operating voltage or temperature.

## CAUTION

Supply voltages larger than 7 V can permanently damage the device (see the Absolute Maximum Ratings) table.

Place $0.1-\mu \mathrm{F}$ bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or highimpedance power supplies. For more information on bypass capacitor placement, see Layout Guidelines.

## 10 Layout

### 10.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and the operational amplifier. Bypass capacitors reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
- Connect low-ESR, $0.1-\mu \mathrm{F}$ ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from $\mathrm{V}_{+}$to ground is applicable for singlesupply applications.
- Separate grounding for analog and digital portions of the circuitry is one of the simplest and most effective methods of noise suppression. One or more layers on multilayer PCBs are typically devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Take care to physically separate digital and analog grounds, paying attention to the flow of the ground current. For more detailed information, see Circuit Board Layout Techniques (SLOA089).
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace perpendicularly is much better than crossing in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keeping RF and RG close to the inverting input minimizes parasitic capacitance, as shown in Layout Example .
- Keep the length of input traces as short as possible. Remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000$ ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width

SCALE:15X

NOTES: (continued)
7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187, variation BA.

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE BASED ON 0.125 mm THICK STENCIL SCALE:10X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

D (R-PDSO-G14)
PLASTIC SMALL OUTLINE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed $0.006(0,15)$ each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed $0.017(0,43)$ each side.
E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.

Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
E. Falls within JEDEC MO-153

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

$R \cup G(R-P Q F P-N 10)$

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
E. Maximum stencil thickness $0,127 \mathrm{~mm}$ ( 5 mils). All linear dimensions are in millimeters.
F. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
G. Side aperture dimensions over-print land for acceptable area ratio $>0.66$. Customer may reduce side aperture dimensions if stencil manufacturing process allows for sufficient release at smaller opening.

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed . 006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

SOLDER MASK DETAILS

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
D Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
E. Falls within JEDEC MO-187 variation AA, except interlead flash.

## DGK (S-PDSO-G8)

## PLAStic SmALL OUTLINE PACKAGE

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.
C. SON (Small Outline No-Lead) package configuration.

D The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
E. JEDEC MO-229 package registration pending.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

SOLDER MASK DETAILS

NOTES: (continued)
4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
