

GENERAL DESCRIPTION

The SGM6603 is a constant frequency, current mode, synchronous boost switching regulator. The input voltage can accept the voltage at a range from 0.9V to 5.5V. And the output voltage is adjustable with a peak of 5.5V. This device also has the 3.3V and 5.0V fixed output versions.

High switching frequency minimizes the sizes of inductor and capacitor. Integrated power MOSFETs and internal compensation make the SGM6603 simple to use and fit the total solution into a compact space.

The SGM6603 enters the power-save mode at light loads to maintain high efficiency. Anti-ringing control circuitry reduces EMI concerns by damping the inductor in discontinuous mode. The SGM6603 provides true output disconnection, allowing V_{OUT} to go to zero volt during shutdown without drawing any current from the input source.

The output voltage of SGM6603-ADJ can be programmed by an external resistor divider, and those of SGM6603-3.3/SGM6603-5.0 are fixed internally on the chip. The device is available in a Green SOT-23-6 package. It operates over an ambient temperature range of -40°C to $+85^{\circ}\text{C}$.

FEATURES

- 0.9V to 5.5V Input Voltage Range
- 3.3V and 5.0V Fixed Output Voltages
- Adjustable Output Voltage up to 5.5V
- 90% Peak Efficiency
- 30 μA (TYP) Quiescent Current
- 1 μA (MAX) Shutdown Current
- 6V Output Voltage Clamping
- Improved Light Load Efficiency with Power-Save Mode (PSM)
- Load Disconnected in Shutdown
- Over-Temperature Protection
- Available in a Green SOT-23-6 Package
- -40°C to $+85^{\circ}\text{C}$ Operating Temperature Range

APPLICATIONS

- Single-Cell Li Battery Powered Products
- Portable Audio Players
- Mobile Phones
- Personal Medical Devices

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

Input Voltage Range on SW, VOUT, VCC, FB, EN
 -0.3V to 6V
 Package Thermal Resistance
 SOT-23-6, θ_{JA} 150°C/W
 Junction Temperature +150°C
 Storage Temperature Range -65°C to +150°C
 Lead Temperature (Soldering, 10s) +260°C
 ESD Susceptibility
 HBM 4000V
 MM 250V

RECOMMENDED OPERATING CONDITIONS

Operating Ambient Temperature Range -40°C to +85°C

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

PIN CONFIGURATION

PIN DESCRIPTION

PIN	NAME	FUNCTION
1	SW	Boost and Rectifying Switch Input.
2	GND	Ground.
3	EN	Enable Input.
4	NC	No Connect. It should be left floating. (SGM6603-3.3/SGM6603-5.0)
	FB	Output Voltage Feedback Pin. An external resistor divider programs the output voltage. (SGM6603-ADJ)
5	VOUT	Output.
6	VCC	Supply Voltage.

ELECTRICAL CHARACTERISTICS

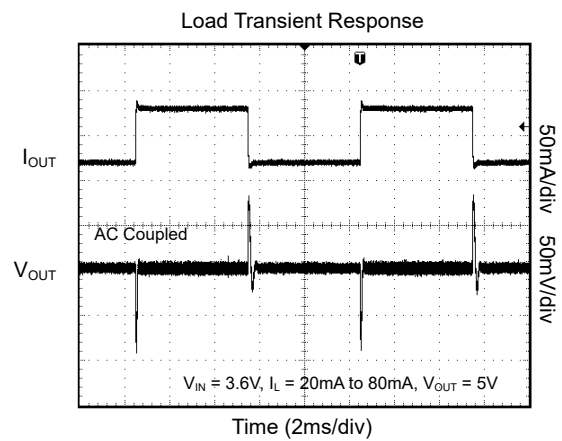

(Full = -40°C to +85°C, typical values are at $T_A = +25^\circ\text{C}$, unless otherwise noted.)

APPLICATION INFORMATION

Design

The SGM6603 is a synchronous boost converter capable of starting up from 0.9V input, which is suitable for majority of readily available input sources. The device is capable of providing up to 5.5V output, and the integrated power MOSFET has 1.1A (TYP) switch current limit.

Startup

After enabling, the device works with a fixed duty cycle of 50% and reduces current limit of 400mA until the output voltage reaches to 2.3V. And then the current limit will be set to 50% of its nominal value to avoid high peak current drawn from the input during startup. The current limit is gradually increased to the nominal value as the output voltage reaches regulation target.

Output Voltage Configuration

The SGM6603 supports output voltage up to 5.5V, and a resistor divider connected at FB pin is used to configure the output voltage. The resistive divider value is calculated via Equation 1.

$$\frac{V_{OUT} - V_{FB}}{R1} = \frac{V_{FB}}{R2} \quad (1)$$

For simplicity, 100kΩ is recommended for R₂. A 560kΩ resistor for R₁ configures the output voltage to 3.3V.

Inductor Selection

Inductor is an essential element for today's DC/DC switch mode power supplies regardless of topology. Inductor serves as the energy storage element for

power conversion. Inductance and inductor's saturation current are two most important criterions for inductor selection. For general rule of thumb, the selected inductance should provide a peak to peak ripple current that is around 30% of the average inductor current at full load and nominal input voltage. The average inductor current for a boost converter is the input current. Equation 2 shows the calculation of inductance selection, where f is the switching frequency, ΔI_L is the inductor ripple current.

$$L = \frac{V_{CC}}{\Delta I_L \times f_{SW}} \times \left(1 - \frac{V_{IN}}{V_O} \right) \quad (2)$$

The selected inductor should have a saturation current rating higher than the 1.1A current limit of SGM6603.

Lastly, the inductor affects the close loop response of the DC/DC converter. The SGM6603 is an internally compensated device with the loop response optimized for inductor in the range of 2.2μH to 10μH.

Input Capacitor

Boost converter's input capacitor sees continuous current throughout the entire switching cycle. A 10μF ceramic capacitor is recommended to place as close as possible between the VCC pin and GND pin of SGM6603. For the applications where the SGM6603 is located far away from the input source, a 47μF or higher capacitance capacitor is recommended to damp the wiring harness's inductance.

APPLICATION INFORMATION (continued)

Output Capacitor

The output capacitors of boost converter dictate the output voltage ripple and load transient response. Equation 3 is used to estimate the necessary capacitance to achieve desired output voltage ripple. Where ΔV is the maximum allowed ripple.

$$C_{\text{MIN}} = \frac{I_{\text{O}} \times (V_{\text{OUT}} - V_{\text{CC}})}{f \times \Delta V \times V_{\text{OUT}}} \quad (3)$$

Again, the SGM6603 is an internally compensated device. The loop response is optimized for capacitor in the range of 4.7 μF to 22 μF . Due to the DC bias nature of ceramic capacitors, care should be taken by verifying manufacture's datasheet to ensure enough effective capacitance at desired output voltage.

Layout Guidelines

In addition to component selection, layout is a critical step to ensure the performance of any switch mode power supplies. Poor layout could result in system instability, EMI failure, and device damage. Thus, place the inductor, input and output capacitors as close to the IC as possible, and use wide and short traces for current carrying traces to minimize PCB inductance.

For boost converter, the output capacitor's current loop from VOUT pin back to the GND pin of the device should be as small as possible.

REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

SEPTEMBER 2021 – REV.A.4 to REV.B	Page
Added Figure 5 Layout Example section	15
AUGUST 2021 – REV.A.3 to REV.A.4	Page
Added the Functional Block Diagram and Startup sections	12, 13
FEBRUARY 2018 – REV.A.2 to REV.A.3	Page
Update the Typical Performance Characteristics	
Efficiency vs. Input Voltage ($V_{OUT} = 3.3V$, $V_{OUT} = 5.0V$)	5
APRIL 2015 – REV.A.1 to REV.A.2	Page
Update the Electrical Characteristics	
V_{IH} ($0.9V \leq V_{CC} \leq 1.8V$) 1.5V - $0.8V_{CC}$	4
JANUARY 2015 – REV.A to REV.A.1	Page
Update the Electrical Characteristics	
Switch Current Limit	4
Add dot on pin 1 SOT-23-6	3, 14
Changes from Original (JANUARY 2013) to REV.A	Page
Changed from product preview to production data	All
