LDO Regulator - Ultra Low I_q, Enable, Reset ³⁵⁰ mA

The NCV8772 is 350 mA LDO regulator with integrated reset functions dedicated for microprocessor applications. Its robustness allows NCV8772 to be used in severe automotive environments. Ultra low quiescent current as low as 24 μ A typical makes it suitable for applications permanently connected to battery requiring ultra low quiescent current with or without load. This feature is especially critical when modules remain in active mode when ignition is off. The Enable function can be used for further decrease of quiescent current in shutdown mode to 1 μ A. The NCV8772 contains protection functions as current limit, thermal shutdown and reverse output current protection.

Features

- Output Voltage Options: 3.3 V and 5 V
- Output Voltage Accuracy: $\pm 1.5\%$ (T_J = 25°C to 125°C)
- Output Current up to 350 mA
- Ultra Low Quiescent Current: typ 24 µA (max 30 µA)
- Very Wide Range of Cout and ESR Values for Stability
- Enable Function
 - 1 µA Max Quiescent Current when disabled
- Microprocessor Compatible Control Functions:
 Reset with Adjustable Power–On Delay
- Wide Input Voltage Operation Range: up to 40 V
- Protection Features
 - Current Limitation
 - Thermal Shutdown
 - Reverse Output Current Protection
- These are Pb–Free Devices

Typical Applications

- Body Control Module
- Instruments and Clusters
- Occupant Protection and Comfort
- Powertrain

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 14 of this data sheet.

PIN CONNECTIONS

PIN FUNCTION DESCRIPTION

Pin No. DPAK-5 D2PAK-5	Pin No. D2PAK-7	Pin Name	Description
1	1	V _{in}	Positive Power Supply Input. Connect 0.1 μ F capacitor to ground.
2	2	RO	Reset Output. 30 k Ω internal Pull-up resistor connected to V _{out} . RO goes Low when V _{out} drops by more than 7% (typ) from its nominal value (for NCV8772y devices with y = 1,2,3,) or more than 10% (typ) from its nominal value (for NCV8772y devices with y = A, B, C,).
-	3	NC	Not Connected
3, TAB	4, TAB	GND	Power Supply Ground.
4	5	EN	Enable Input. Low level disables the IC.
_	6	DT	Reset Delay Time Select. Short to GND or connected to V _{out} to select time.
5	7	Vout	Regulated Output Voltage. Connect 1 μF capacitor with ESR < 100 Ω to ground.

ABSOLUTE MAXIMUM RATINGS

Rating		Symbol	Min	Мах	Unit
Input Voltage (Note 1)	DC Transient, t < 100 ms	V _{in}	-0.3 -	40 45	V

9. Refer to ABSOLUTE MAXIMUM RATINGS and APPLICATION INFORMATION for Safe Operating Area.

Performance guaranteed over the indicated operating testing to maintain the junction temperature as close to ambient as possible.
 Measured when output voltage falls 100 mV below the regulated voltage at V_{in} = 13.2 V.

Values based on design and/or characterization.
 See APPLICATION INFORMATION section for Reset Thresholds and Reset Delay Time Options

DEFINITIONS

General

All measurements are performed using short pulse low duty cycle techniques to maintain junction temperature as close as possible to ambient temperature.

Output voltage

The output voltage parameter is defined for specific temperature, input voltage and output current values or specified over Line, Load and Temperature ranges.

Line Regulation

The change in output voltage for a change in input voltage measured for specific output current over operating ambient temperature range.

Load Regulation

The change in output voltage for a change in output current measured for specific input voltage over operating ambient temperature range.

Dropout Voltage

The input to output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. It is measured when the output drops 100 mV below its nominal value. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

Quiescent and Disable Currents

Quiescent Current (I_q) is the difference between the input current (measured through the LDO input pin) and the output load current. If Enable pin is set to LOW the regulator reduces its internal bias and shuts off the output, this term is called the disable current (I_{DIS}).

Current Limit and Short Circuit Current Limit

Current Limit is value of output current by which output voltage drops below 96% of its nominal value. Short Circuit Current Limit is output current value measured with output of the regulator shorted to ground.

PSRR

Power Supply Rejection Ratio is defined as ratio of output voltage and input voltage ripple. It is measured in decibels (dB).

Line Transient Response

Typical output voltage overshoot and undershoot response when the input voltage is excited with a given slope.

Load Transient Response

Typical output voltage overshoot and undershoot response when the output current is excited with a given slope between low-load and high-load conditions.

Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 175°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

Maximum Package Power Dissipation

The power dissipation level is maximum allowed power dissipation for particular package or power dissipation at which the junction temperature reaches its maximum operating value, whichever is lower.

APPLICATIONS INFORMATION

The NCV8772 regulator is self–protected with internal thermal shutdown and internal current limit. Typical characteristics are shown in Figure 4 to Figure 33.

Input Decoupling (Cin)

A ceramic or tantalum 0.1 μ F capacitor is recommended and should be connected close to the NCV8772 package. Higher capacitance and lower ESR will improve the overall line and load transient response.

If extremely fast input voltage transients are expected then appropriate input filter must be used in order to decrease rising and/or falling edges below 50 V/ μ s for proper operation. The filter can be composed of several capacitors in parallel.

Output Decoupling (Cout)

The NCV8772 is a stable component and does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. Stability region of ESR vs Output Current is shown in Figure 17. The minimum output decoupling value is 1 μ F and can be augmented to fulfill stringent load transient requirements. The regulator works with ceramic chip capacitors as well as tantalum devices. Larger values improve noise rejection and load regulation transient response.

Enable Operation

The Enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this datasheet.

Reset Operation

A reset signal is provided on the Reset Output (RO) pin to provide feedback to the microprocessor of an out of regulation condition. The timing diagram of reset function is shown in Figure 33. This is in the form of a logic signal on RO. Output voltage conditions below the RESET threshold cause RO to go low. The RO integrity is maintained down to $V_{out} = 1.0$ V. For 5 V voltage option, the Reset Output (RO) circuitry includes internal pull–up (30 k Ω) connected to the output (V_{out}) No external pull–up is necessary.

RESET	DELAY	AND F	RESET	THRESH	IOLD (OPTIONS
(DPAK-	-5 AND	D2PAK	(–5)			

	Reset Delay Time	Reset Threshold
NCV87721DT NCV87721D5S	8 ms	93%
NCV87722DT NCV87722D5S	16 ms	93%

NCV8772BDT NCV8772BD5S	16 ms	90%
NCV8772CDT NCV8772CD5S	32 ms	90%
NCV8772DDT NCV8772DD5S	64 ms	90%
NCV8772EDT NCV8772ED5S	128 ms	90%

NOTE: The timing values can be selected from the following list: 8, 16, 32, 64, 128 ms. Contact factory for options not included in ORDERING INFORMATION table on page 14.

Reset Delay Time Select (D2PAK-7 only)

Selection of the NCV8772yD7S devices and the state of the DT pin determines the available Reset Delay times. The part is designed for use with DT tied to ground or V_{out} , but may be controlled by any logic signal which provides a threshold between 0.8 V and 2 V. The default condition for an open DT pin is the slower Reset time (DT = GND condition). Times are in pairs and are highlighted in the chart below. Consult factory for availability. The Delay Time select (DT) pin is logic level controlled and provides Reset Delay time per the chart. Note the DT pin is sampled only when RO is low, and changes to the DT pin when RO is high will not effect the reset delay time.

RESET DELAY	AND RESET	THRESHOLD	OPTIONS
(D2PAK-7)			

	DT = GND Reset Time	DT = V _{out} Reset Time	Reset Threshold
NCV87721D7S	8 ms	128 ms	93%

NCV8772CD7S	16 ms	64 ms	90%
NCV8772DD7S	32 ms	128 ms	90%
NCV8772ED7S	4 ms	8 ms	90%

NOTE: The timing values can be selected from the following list: 4, 8, 16, 32, 64, 128 ms. Contact factory for options not included in ORDERING INFORMATION table on page 14.

Thermal Considerations

As power in the NCV8772 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the NCV8772 has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the NCV8772 can handle is given by:

$$P_{D(max)} = \frac{\left[T_{J(max)} - T_{A}\right]}{R_{\theta,IA}}$$
(eq. 1)

Since T_J is not recommended to exceed 150°C, then the NCV8772 soldered on 645 mm², 1 oz copper area, FR4 can

ORDERING INFORMATION

dissipate up to 2.35 W (for D2PAK–5) when the ambient temperature (T_A) is 25°C. See Figure 34 for $R_{\theta JA}$ versus PCB area. The power dissipated by the NCV8772 can be calculated from the following equations:

$$\mathsf{P}_{\mathsf{D}} = \mathsf{V}_{\mathsf{in}} \big(\mathsf{I}_{\mathsf{q}} @ \mathsf{I}_{\mathsf{out}} \big) + \mathsf{I}_{\mathsf{out}} \big(\mathsf{V}_{\mathsf{in}} - \mathsf{V}_{\mathsf{out}} \big) \qquad (\mathsf{eq. 2})$$

or

$$V_{in(max)} = \frac{P_{D(max)} + (V_{out} \times I_{out})}{I_{out} + I_{q}}$$
(eq. 3)

NOTE: Items containing I_q can be neglected if $I_{out} >> I_q$.

Hints

 V_{in} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the NCV8772 and make traces as short as possible.
