

NCP2860

300 mA Very Low Noise, Low Dropout Linear Regulator

The NCP2860 is a low noise, low dropout linear regulator that is offered as a fixed output voltage regulator (2.77 V) and as an adjustable output regulator from 1.25 V to 5.80 V. It supplies 300 mA from a 3.0 V to 6.0 V input. The excellent performances that the NCP2860 features in terms of transient responses, PSRR and noise, make it an ideal solution for audio applications (e.g., audio amplifier drivers).

Features

- High Output Current (300 mA Max)
- Low Output Voltage Noise: 60 μ Vrms
- Low Dropout (150 mV @ $I_{out} = 300$ mA)
- Thermal Overload and Short Circuit Protections
- Very Low Consumption in Shutdown Mode (10 nA)
- High Power Supply Rejection Ratio (60 dB @ 1.0 kHz)
- $\overline{\text{FAULT}}$ Indicator
- Programmable Output Voltage
- Soft-Start
- Pb-Free Package is Available

Typical Applications

- Cellular Phone
- Handheld Instruments

NCP2860

PIN DESCRIPTION

Pin	Name	Description
1, 4	OUT	"OUT" is the regulator output. A low ESR, bypass capacitor should be connected for stable operation.
2	IN	"IN" is the supply input that is connected to the power source (up to 6.0 V). Bypass with a 2.2 μ F capacitor.
3	GND	Ground
5	SET	Ground the "SET" pin to set the output voltage to 2.77 V. Connect to resistor–divider for ADJ output voltage. Refer to the "output voltage setting" paragraph if you need to program another value.
6	N.C.	This pin is non–connected.
7	STDWN	If the "STDWN" pin is low, the circuit enters the shutdown mode.
8	FAULT	The "FAULT" terminal is a high impedance, open drain output. If the circuit is out of regulation, the voltage pin goes low. Otherwise (normal operation or shutdown mode), this pin is high impedance. Connect the pin to ground, if unused.

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage, Shutdown Pin, Voltage Range (Note 1)	V_{inmax}	–0.3, +6.0	V
Thermal Resistance (Note 2)	–	230	$^{\circ}$ C/W
Maximum Junction Temperature	T_{Jmax}	150	$^{\circ}$ C
Storage Temperature Range	T_{Smax}	– 65 to +150	$^{\circ}$ C
Lead Temperature (Soldering, 10s)	T_{Lmax}	300	$^{\circ}$ C
ESD Capability Human Body Model	–	2.0	kV
Machine Model	–	200	V
Latchup Capability @ 85 $^{\circ}$ C	–	+/–100	mA

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The recommended input voltage range for NCP2860 proper operation is 2.7 V to 6.0 V.
2. Circuit being mounted on a board that has no metal oxide traces attached to the leads. The addition of plated copper can lower the thermal resistance.

NCP2860

TYPICAL ELECTRICAL CHARACTERISTICS (Note 3) ($V_{in} = 3.6\text{ V}$, T_A from -25°C to $+85^{\circ}\text{C}$, unless otherwise noted.)

Characteristic for 2.77 V Fix Version SET = GND	Symbol	Min	Typ	Max	Unit

DETAILED OPERATING DESCRIPTION

Internal Pass Transistor

The NCP2860 incorporates a 0.5 Ω typical P-channel MOSFET pass transistor. The P-channel MOSFET requires no drive current and then compared to the PNP based regulators, this solution drastically reduces the quiescent current and associated losses.

Shutdown Block

The circuit turns into shutdown mode when the shutdown pin is in low state. In this mode, the internal biasing current sources are disconnected so that the pass transistor is off and the consumption reduced to a minimum value. Practically, the shutdown consumption is in the range of 10 nA. When this function is unused, "IN" is generally applied to the shutdown pin.

Current Limitation

The NCP2860 incorporates a short circuit protection that prevents the pass transistor current from exceeding 465 mA typically. The current limit is set to 220 mA during the start-up phase.

Thermal Protection

The thermal protection protects the die against excessive overheating. Practically, when the junction temperature exceeds 170°C for the 2.77 V option and 150°C for the 3.0 V option, an internal thermal sensor sends a logical signal to the shutdown block so that the circuit enters the shutdown mode. Once the die has cooled enough (typically 30°C), the circuit enters a new working phase.

Output Voltage Setting

- The output voltage is set by internal resistor divider to 2.77 V for NCP2860DM277R2 device. The "SET" pin must be grounded or pulled below 0.2 V.
- The output voltage can also be programmed to a different value for NCP2860DMADJR2G device. In this case a portion of the output voltage acquired by the external resistor divider must be applied to the "SET" pin. Do not leave the "SET" pin unconnected. If a (R1, R2) external resistors divider is used, then output voltage is given by equation:

$$V_{out} = (1 + R1/R2) * V_{ref}$$

Therefore, as V_{ref} typically equals 1.244 V:

$$V_{out} = 1.244 * (1 + R1/R2).$$

Now if R1 and R2 are high impedance resistors, the leakage current that is absorbed by the "SET" pin, may have to be taken into account as follows:

$$V_{out} = [1.244 * (1 + R1/R2)] + (R1 * I_{lk}) \text{ where } I_{lk} \text{ is the "SET" pin leakage current.}$$

If the output voltage is directly applied to the "SET" pin, $V_{out} = V_{ref} = 1.244$ V.

Regulation

The circuit incorporates a transconductance error amplifier. The error amplifier output varies in response to load and input voltage variations to control the pass transistor current so that the "OUT" pin delivers the wished voltage. No compensation capacitor is required.

Fault Detection Circuitry

The circuit detects when the input-output differential voltage is too low to ensure a correct load and line regulation at the output. The input-output differential threshold scales proportionally with the load current to be always just higher than the dropout.

When the circuit detects a fault condition, an internal switch connects "FAULT" to ground. In normal operation, the "FAULT" terminal is an open-drain-N-channel MOSFET and if a pull-up resistor is connected between "OUT" and "FAULT", "FAULT" goes high. The pullup resistor is generally selected in the range of 100 k Ω to minimize the current consumption.

Application Information

It is recommended to use 2.2 μ F capacitors on the input and on the output of the NCP2860. Capacitor type is not very critical. Simply the ESR should be lower than 0.5 Ω to ensure a stable operation over the temperature and output current ranges. It could be convenient to increase the capacitor size and its quality (lower ESR) only if it was necessary to further improve the noise performances, the Power Supply Rejection Ratio or the fast transient response.
