

24位模数转换器

 查询样品: [ADS1243-HT](#)

特性

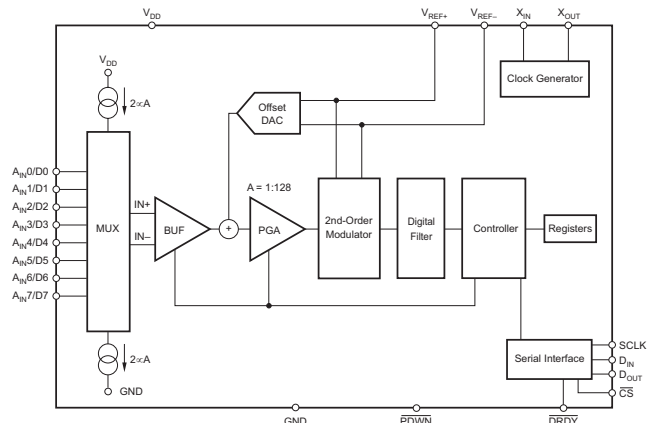

- **24位无丢码**
- 同步**50Hz**和**60Hz**抑制制 (最小**-90 dB**)
- **0.0025%** 积分非线性(INL)
- 可编程增益放大器(PGA)增益从**1**到**128**
- 单循环建立
- 可编程数据输出速率
- **0.1V**至**0.5V**外部差分基准
- 片载校准
- 与**SPI™**兼容
- **2.7V**至**5.25V**电源范围
- **600μW**功率耗散
- 最多**8**个输入通道
- 最多**8**个数据I/O

应用范围

- 潜孔打钻
- 高温环境
- 振动/模式分析
- 多通道数据采集
- 声学/动态应变仪
- 压力传感器

支持极端温度环境下的应用

- 受控基线
- 一个组装/测试场所
- 一个制造场所
- 可在极端温度范围 (**-55°C/210°C**) 下工作⁽¹⁾
- 延长的产品使用寿命周期
- 延长产品的变更通知周期
- 产品可追溯性
- 德州仪器的高温产品使用高度优化的硅(芯片)解决方案, 此方案提升设计和制造工艺, 以大大提高拓展温度范围内的性能。所有器件可在最大额定温度下连续运行**1000**小时。

(1) 可定制温度范围

说明

ADS1243是一款高精度, 宽动态范围, Δ - Σ , 模数(A/D)转换器, 此转换器的运行电压为2.7V至5.25V并具有24位分辨率。此 Δ - Σ , A/D转换器能提供最高24位的无丢码性能并且其有效分辨率为21位。

此输入通道是复用的。可选择内部缓冲来为到变频器的直接连接或者低水平电压信号提供一个非常高的输入阻抗。提供的熔断电流可用于检测开式或者短接传感器。一个8位模数转换器(DAC)提供一个FSR(满刻度范围)50%的偏差校正。

此可编程增益放大器(PGA)提供1到128间的可选增益(128增益时的有效分辨率为19位)。A/D转换由一个二级 Δ - Σ 调制器和一个可提供同步50Hz和60Hz陷波的可编程有限脉冲响应(FIR)滤波器来完成的。此基准输入是差分的并可被用于比例转换。

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

此串口与串行外设接口(SPI)兼容。提供最多8位数据I/O用于输入或者输出。ADS1243设计用于智能发送器，工业过程控制，称量台，套色版和便携式仪器中的高分辨率测量应用。

ORDERING INFORMATION⁽¹⁾

T _A	PACKAGE	ORDERABLE PART NUMBER	TOP-SIDE MARKING
-55°C to 210°C	JD	ADS1243SJD	ADS1243SJD
	KGD	ADS1243SKGD1	NA

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	VALUE	UNIT
V _{DD} to GND	-0.3 to 6	V
Input Current	100, Momentary	mA
Input Current	10, Continuous	mA
A _{IN}	GND - 0.5 to V _{DD} + 0.5	V
Digital Input Voltage to GND	-0.3V to V _{DD} + 0.3	V
Digital Output Voltage to GND	-0.3V to V _{DD} + 0.3	V
Maximum Junction Temperature	215	°C
Operating Temperature Range	-55 to 210	°C
Storage Temperature Range	-65 to 100	°C

(1) Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

THERMAL CHARACTERISTICS

(2) ΔV_{OUT} is a change in digital result.

(3) 12-pF switched capacitor at f_{SAMP} clock frequency.

- (1) See data sheet for absolute maximum and minimum recommended operating conditions.
- (2) Silicon operating life design goal is 10 years at 105°C junction temperature (does not include package interconnect life).
- (3) The predicted operating lifetime vs. junction temperature is based on reliability modeling using electromigration as the dominant failure mechanism affecting device wearout for the specific device process and design characteristics.

OVERVIEW

INPUT MULTIPLEXER

The input multiplexer provides for any combination of differential inputs to be selected on any of the input channels, as shown in Figure 2. For example, if A_{IN0} is selected as the positive differential input channel, any other channel can be selected as the negative terminal for the differential input channel. With this method, it is possible to have up to seven single-ended input channels or four independent differential input channels for the ADS1243.

The ADS1243 features a single-cycle settling digital filter that provides valid data on the first conversion after a new channel selection. In order to minimize the settling error, synchronize MUX changes to the conversion beginning, which is indicated by the falling edge of \overline{DRDY} . In other words, issuing a MUX change through the WREG command immediately after \overline{DRDY} goes LOW minimizes the settling error. Increasing the time between the conversion beginning (\overline{DRDY} goes LOW) and the MUX change command (t_{DELAY}) results in a settling error in the conversion data, as shown in Figure 3.

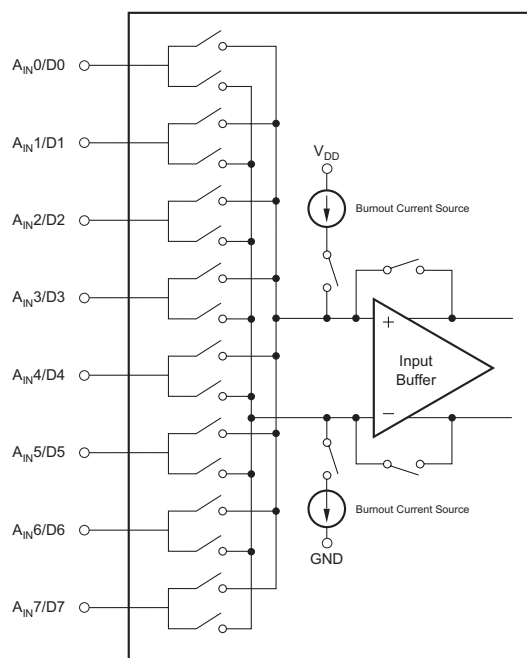

Figure 2. Input Multiplexer Configuration

Figure 3. Input Multiplexer Configuration

BURNOUT CURRENT SOURCES

The Burnout Current Sources can be used to detect sensor short-circuit or open-circuit conditions. Setting the Burnout Current Sources (BOCS) bit in the SETUP register activates two 2 μ A current sources called burnout current sources. One of the current sources is connected to the converter's negative input and the other is connected to the converter's positive input.

Figure 4 shows the situation for an open-circuit sensor. This is a potential failure mode for many kinds of remotely connected sensors. The current source on the positive input acts as a pull-up, causing the positive input to go to the positive analog supply, and the current source on the negative input acts as a pull-down, causing the negative input to go to ground. The ADS1243 therefore outputs full-scale (7FFFFFFF Hex).

Figure 5 shows a short-circuited sensor. Since the inputs are shorted and at the same potential, the ADS1243 signal outputs are approximately zero. (Note that the code for shorted inputs is not exactly zero due to internal series resistance, low-level noise and other error sources.)

Figure 4. Burnout Detection While Sensor is Open-Circuited.

Figure 5. Burnout Detection While Sensor is Short-Circuited.

INPUT BUFFER

The input impedance of ADS1243 without the buffer enabled is approximately $5\text{M}\Omega/\text{PGA}$. For systems requiring very high input impedance, the ADS1243 provides a chopper-stabilized differential FET-input voltage buffer. When activated, the buffer raises the ADS1243 input impedance to approximately $5\text{G}\Omega$.

The buffer's input range is approximately 50mV to $V_{\text{DD}} - 1.5\text{V}$. The buffer's linearity will degrade beyond this range. Differential signals should be adjusted so that both signals are within the buffer's input range.

The buffer can be enabled using the BUFEN pin or the BUFEN bit in the ACR register. The buffer is on when the BUFEN pin is high and the BUFEN bit is set to one. If the BUFEN pin is low, the buffer is disabled. If the BUFEN bit is set to zero, the buffer is also disabled.

The buffer draws additional current when activated. The current required by the buffer depends on the PGA setting. When the PGA is set to 1, the buffer uses approximately $50\text{ }\mu\text{A}$; when the PGA is set to 128, the buffer uses approximately $500\text{ }\mu\text{A}$.

PGA

The Programmable Gain Amplifier (PGA) can be set to gains of 1, 2, 4, 8, 16, 32, 64, or 128. Using the PGA can improve the effective resolution of the A/D converter. For instance, with a PGA of 1 on a 5-V full-scale signal, the A/D converter can resolve down to $1\text{ }\mu\text{V}$. With a PGA of 128 and a full-scale signal of 39 mV , the A/D converter can resolve down to 75 nV . V_{DD} current increases with PGA settings higher than 4.

OFFSET DAC

The input to the PGA can be shifted by half the full-scale input range of the PGA using the Offset DAC (ODAC) register. The ODAC register is an 8-bit value; the MSB is the sign and the seven LSBs provide the magnitude of the offset. Using the offset DAC does not reduce the performance of the A/D converter. For more details on the ODAC in the ADS1243, please refer to TI application report SBAA077 (available through the TI website).

MODULATOR

The modulator is a single-loop second-order system. The modulator runs at a clock speed (f_{MOD}) that is derived from the external clock (f_{OSC}). The frequency division is determined by the SPEED bit in the SETUP register, as shown in [Table 2](#).

Table 2. Output Configuration

f _{osc}	SPEED BIT	f _{MOD}	DR BITS			1st NOTCH FREQUENCY
			00	01	10	
2.4576 MHz	0	19,200 Hz	15 Hz	7.5 Hz	3.75 Hz	50/60 Hz
	1	9,600 Hz	7.5 Hz	3.75 Hz	1.875 Hz	25/30 Hz
4.9152 MHz	0	38,400 Hz	30 Hz	15 Hz	7.5 Hz	100/120 Hz
	1	19,200 Hz	15 Hz	7.5 Hz	3.75 Hz	50/60 Hz

CALIBRATION

The offset and gain errors can be minimized with calibration. The ADS1243 supports both self and system calibration.

Self-calibration of the ADS1243 corrects internal offset and gain errors and is handled by three commands: SELFCAL, SELFGAL, and SELFOCAL. The SELFCAL command performs both an offset and gain calibration. SELFGAL performs a gain calibration and SELFOCAL performs an offset calibration, each of which takes two t_{DATA} periods to complete. During self-calibration, the ADC inputs are disconnected internally from the input pins. The PGA must be set to 1 prior to issuing a SELFCAL or SELFGAL command. Any PGA is allowed when issuing a SELFOCAL command. For example, if using PGA = 64, first set PGA = 1 and issue SELFGAL. Afterwards, set PGA = 64 and issue SELFOCAL. For operation with a reference voltage greater than (V_{DD} – 1.5) volts, the buffer must also be turned off during gain self-calibration to avoid exceeding the buffer input range.

System calibration corrects both internal and external offset and gain errors. While performing system calibration, the appropriate signal must be applied to the inputs. The system offset calibration command (SYSOCAL) requires a zero input differential signal (see Table 5). It then computes the offset that nullifies the offset in the system. The system gain calibration command (SYSGCAL) requires a positive full-scale input signal. It then computes a value to nullify the gain error in the system. Each of these calibrations takes two t_{DATA} periods to complete. System gain calibration is recommended for the best gain calibration at higher PGAs.

Calibration should be performed after power on, a change in temperature, or a change of the PGA. The RANGE bit (ACR bit 2) must be zero during calibration.

Calibration removes the effects of the ODAC; therefore, disable the ODAC during calibration, and enable again after calibration is complete.

At the completion of calibration, the $\overline{\text{DRDY}}$ signal goes low, indicating the calibration is finished. The first data after calibration should be discarded since it may be corrupt from calibration data remaining in the filter. The second data is always valid.

EXTERNAL VOLTAGE REFERENCE

The ADS1243 requires an external voltage reference. The selection for the voltage reference value is made through the ACR register.

The external voltage reference is differential and is represented by the voltage difference between the pins: +V_{REF} and –V_{REF}. The absolute voltage on either pin, +V_{REF} or –V_{REF}, can range from GND to V_{DD}. However, the following limitations apply:

- For V_{DD} = 5 V and RANGE = 0 in the ACR, the differential V_{REF} must not exceed 2.5 V.
- For V_{DD} = 5 V and RANGE = 1 in the ACR, the differential V_{REF} must not exceed 5 V.
- For V_{DD} = 3 V and RANGE = 0 in the ACR, the differential V_{REF} must not exceed 1.25 V.
- For V_{DD} = 3 V and RANGE = 1 in the ACR, the differential V_{REF} must not exceed 2.5 V.

CLOCK GENERATOR

The clock source for ADS1243 can be provided from a crystal, oscillator, or external clock. When the clock source is a crystal, external capacitors must be provided to ensure start-up and stable clock frequency. This is shown in both Figure 6 and Table 3. X_{OUT} is only for use with external crystals and it should not be used as a clock driver for external circuitry.

Figure 6. Crystal Connection.

Table 3. Recommended Crystals

CLOCK SOURCE	FREQUENCY	C ₁	C ₂	PART NUMBER
Crystal	2.4576	0-20 pF	0-20 pF	ECS, ECSD 2.45 – 32
Crystal	4.9152	0-20 pF	0-20 pF	ECS, ECLS 4.91
Crystal	4.9152	0-20 pF	0-20 pF	ECS, ECSD 4.91
Crystal	4.9152	0-20 pF	0-20 pF	CTS, MP 042 4M9182

DIGITAL FILTER

The ADS1243 has a 1279 tap linear phase Finite Impulse Response (FIR) digital filter that a user can configure for various output data rates. When a 2.4576-MHz crystal is used, the device can be programmed for an output data rate of 15 Hz, 7.5 Hz, or 3.75 Hz. Under these conditions, the digital filter rejects both 50Hz and 60Hz interference. Figure 7 shows the digital filter frequency response for data output rates of 15 Hz, 7.5 Hz, and 3.75 Hz.

If a different data output rate is desired, a different crystal frequency can be used. However, the rejection frequencies shift accordingly. For example, a 3.6864-MHz master clock with the default register condition has:

$$(3.6864 \text{ MHz} / 2.4576 \text{ MHz}) \bullet 15 \text{ Hz} = 22.5 \text{ Hz data output rate}$$

and the first and second notch is:

$$1.5 \bullet (50 \text{ Hz and } 60 \text{ Hz}) = 75 \text{ Hz and } 90 \text{ Hz}$$

Figure 7. Filter Frequency Responses

DATA I/O INTERFACE

The ADS1243 has eight pins that serve a dual purpose as both analog inputs and data I/O. These pins are configured through the IOCON, DIR, and DIO registers and can be individually configured as either analog inputs or data I/O. See Figure 8 for the equivalent schematic of an Analog/Data I/O pin.

The IOCON register defines the pin as either an analog input or data I/O. The power-up state is an analog input. If the pin is configured as an analog input in the IOCON register, the DIR and DIO registers have no effect on the state of the pin.

If the pin is configured as data I/O in the IOCON register, then DIR and DIO are used to control the state of the pin. The DIR register controls the direction of the data pin, either as an input or output. If the pin is configured as an input in the DIR register, then the corresponding DIO register bit reflects the state of the pin. Make sure the pin is driven to a logic one or zero when configured as an input to prevent excess current dissipation. If the pin is configured as an output in the DIR register, then the corresponding DIO register bit value determines the state of the output pin (0 = GND, 1 = V_{DD}).

It is still possible to perform A/D conversions on a pin configured as data I/O. This may be useful as a test mode, where the data I/O pin is driven and an A/D conversion is done on the pin.

Figure 8. Analog/Data Interface Pin

SERIAL PERIPHERAL INTERFACE

The Serial Peripheral Interface (SPI) allows a controller to communicate synchronously with the ADS1243. The ADS1243 operates in slave-only mode. The serial interface is a standard four-wire SPI (\overline{CS} , SCLK, D_{IN} and D_{OUT}) interface.

Chip Select (\overline{CS})

The chip select (\overline{CS}) input must be externally asserted before communicating with the ADS1243. \overline{CS} must stay LOW for the duration of the communication. Whenever \overline{CS} goes HIGH, the serial interface is reset. \overline{CS} may be hard-wired LOW.

Serial Clock (SCLK)

The serial clock (SCLK) features a Schmitt-triggered input and is used to clock D_{IN} and D_{OUT} data. Make sure to have a clean SCLK to prevent accidental double-shifting of the data. If SCLK is not toggled within three \overline{DRDY} pulses, the serial interface resets on the next SCLK pulse and starts a new communication cycle. A special pattern on SCLK resets the entire chip; see the RESET section for additional information.

Data Input (D_{IN}) and Data Output (D_{OUT})

The data input (D_{IN}) and data output (D_{OUT}) receive and send data from the ADS1243. D_{OUT} is high impedance when not in use to allow D_{IN} and D_{OUT} to be connected together and driven by a bidirectional bus. Note: the Read Data Continuous Mode (RDATAC) command should not be issued when D_{IN} and D_{OUT} are connected. While in RDATAC mode, D_{IN} looks for the STOPC or RESET command. If either of these 8-bit bytes appear on D_{OUT} (which is connected to D_{IN}), the RDATAC mode ends.

DATA READY ($\overline{\text{DRDY}}$) PIN

The $\overline{\text{DRDY}}$ line is used as a status signal to indicate when data is ready to be read from the internal data register. $\overline{\text{DRDY}}$ goes LOW when a new data word is available in the DOR register. It is reset HIGH when a read operation from the data register is complete. It also goes HIGH prior to the updating of the output register to indicate when not to read from the device to ensure that a data read is not attempted while the register is being updated.

The status of $\overline{\text{DRDY}}$ can also be obtained by interrogating bit 7 of the ACR register (address 2_{H}). The serial interface can operate in 3-wire mode by tying the $\overline{\text{CS}}$ input LOW. In this case, the SCLK, D_{IN} , and D_{OUT} lines are used to communicate with the ADS1243. This scheme is suitable for interfacing to microcontrollers. If $\overline{\text{CS}}$ is required as a decoding signal, it can be generated from a port bit of the microcontroller.

DSYNC OPERATION

Synchronization can be achieved through the DSYNC command. When the DSYNC command is sent, the digital filter is reset on the edge of the last SCLK of the DSYNC command. The modulator is held in RESET until the next edge of SCLK is detected. Synchronization occurs on the next rising edge of the system clock after the first SCLK following the DSYNC command.

POWER-UP—SUPPLY VOLTAGE RAMP RATE

The power-on reset circuitry was designed to accommodate digital supply ramp rates as slow as 1 V/10 ms. To ensure proper operation, the power supply should ramp monotonically.

ADS1243 REGISTERS

The operation of the device is set up through individual registers. Collectively, the registers contain all the information needed to configure the part, such as data format, multiplexer settings, calibration settings, data rate, etc. The 16 registers are shown in [Table 4](#).

Table 4. Registers

ADDRESS	REGISTER	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
00 _H	SETUP	ID	ID	ID	ID	BOCS	PGA2	PGA1	PGA0

DETAILED REGISTER DEFINITIONS

Setup

(Address 00_H) Setup Register

Reset Value = iiiii0000

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
ID	ID	ID	ID	BOCS	PGA2	PGA1	PGA0

bit 7–4 Factory Programmed Bits

bit 3 BOCS: Burnout Current Source

0 = Disabled (default)

1 = Enabled

bit 2–0 PGA2: PGA1: PGA0: Programmable Gain Amplifier

Gain Selection

000 = 1 (default)

001 = 2

010 = 4

011 = 8

100 = 16

101 = 32

110 = 64

111 = 128

MUX

(Address 01_H) Multiplexer Control Register

Reset Value = 01_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
PSEL3	PSEL2	PSEL1	PSEL0	NSEL3	NSEL2	NSEL1	NSEL0

bit 7–4 PSEL3: PSEL2: PSEL1: PSEL0: Positive Channel

Select

- 0000 = A_{IN}0 (default)
- 0001 = A_{IN}1
- 0010 = A_{IN}2
- 0011 = A_{IN}3
- 0100 = A_{IN}4
- 0101 = A_{IN}5
- 0110 = A_{IN}6
- 0111 = A_{IN}7
- 1111 = Reserved

bit 3–0 NSEL3: NSEL2: NSEL1: NSEL0: Negative Channel

Select

- 0000 = A_{IN}0
- 0001 = A_{IN}1 (default)
- 0010 = A_{IN}2
- 0011 = A_{IN}3
- 0100 = A_{IN}4
- 0101 = A_{IN}5
- 0110 = A_{IN}6
- 0111 = A_{IN}7
- 1111 = Reserved

ACR

(Address 02_H) Analog Control Register

Reset Value = X0_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
$\overline{\text{DRDY}}$	U/B	SPEED	BUFEN	BIT ORDER	RANGE	DR1	DR0

bit 7 $\overline{\text{DRDY}}$: Data Ready (Read Only)
This bit duplicates the state of the $\overline{\text{DRDY}}$ pin.

bit 6 U/B: Data Format
0 = Bipolar (default)
1 = Unipolar

U/B	ANALOG INPUT	DIGITAL OUTPUT (Hex)
0	+FSR	0x7FFFFFFF
	Zero	0x000000
	–FSR	0x800000
1	+FSR	0xFFFFFFFF
	Zero	0x000000
	–FSR	0x000000

- bit 5 SPEED: Modulator Clock Speed
 0 = $f_{MOD} = f_{OSC}/128$ (default)
 1 = $f_{MOD} = f_{OSC}/256$
- bit 4 BUFEN: Buffer Enable
 0 = Buffer Disabled (default)
 1 = Buffer Enabled
- bit 3 BIT ORDER: Data Output Bit Order
 0 = Most Significant Bit Transmitted First (default)
 1 = Least Significant Bit Transmitted First
 Data is always shifted in or out MSB first.
- bit 2 RANGE: Range Select
 0 = Full-Scale Input Range equal to $\pm V_{REF}$ (default).
 1 = Full-Scale Input Range equal to $\pm 1/2 V_{REF}$
 NOTE: This allows reference voltages as high as V_{DD} , but even with a 5V reference voltage the calibration must be performed with this bit set to 0.
- bit 1–0 DR1: DR0: Data Rate
 ($f_{OSC} = 2.4576\text{MHz}$, SPEED = 0)
 00 = 15 Hz (default)
 01 = 7.5 Hz
 10 = 3.75 Hz
 11 = Reserved

ODAC

(Address 03) Offset DAC

Reset Value = 00_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
SIGN	OSET6	OSET5	OSET4	OSET3	OSET2	OSET1	OSET0

- bit 7 Sign
 0 = Positive
 1 = Negative

$$\text{Offset} = \frac{V_{REF}}{2 \cdot \text{PGA}} \cdot \left(\frac{\text{OSET}[6:0]}{127} \right) \text{ RANGE} = 0$$

$$\text{Offset} = \frac{V_{REF}}{4 \cdot \text{PGA}} \cdot \left(\frac{\text{OSET}[6:0]}{127} \right) \text{ RANGE} = 1$$

NOTE: The offset DAC must be enabled after calibration or the calibration nullifies the effects.

DIO

(Address 04_H) Data I/O

Reset Value = 00_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
DIO 7	DIO 6	DIO 5	DIO 4	DIO 3	DIO 2	DIO 1	DIO 0

If the IOCON register is configured for data, a value written to this register appears on the data I/O pins if the pin is configured as an output in the DIR register. Reading this register returns the value of the data I/O pins.

DIR

(Address 05_H) Direction Control for Data I/O

Reset Value = FF_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
DIR7	DIR6	DIR5	DIR4	DIR3	DIR2	DIR1	DIR0

Each bit controls whether the corresponding data I/O pin is an output (= 0) or input (= 1). The default power-up state is as inputs.

IOCON

(Address 06_H) I/O Configuration Register

Reset Value = 00_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
IO7	IO6	IO5	IO4	IO3	IO2	IO1	IO0

bit 7-0 IO7: IO0: Data I/O Configuration

0 = Analog (default)

1 = Data

Configuring the pin as a data I/O pin allows it to be controlled through the DIO and DIR registers.

ORC0

(Address 07_H) Offset Calibration Coefficient

(Least Significant Byte)

Reset Value = 00_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
OCR07	OCR06	OCR05	OCR04	OCR03	OCR02	OCR01	OCR00

OCR1

(Address 08_H) Offset Calibration Coefficient

(Middle Byte)

Reset Value = 00_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
OCR15	OCR14	OCR13	OCR12	OCR11	OCR10	OCR09	OCR08

OCR2

(Address 09_H) Offset Calibration Coefficient

(Most Significant Byte)

Reset Value = 00_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
OCR23	OCR22	OCR21	OCR20	OCR19	OCR18	OCR17	OCR16

FSR0

(Address 0A_H) Full-Scale Register

(Least Significant Byte)

Reset Value = 59_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
FSR07	FSR06	FSR05	FSR04	FSR03	FSR02	FSR01	FSR00

FSR1

 (Address 0B_H) Full-Scale Register

(Middle Byte)

 Reset Value = 55_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
FSR15	FSR14	FSR13	FSR12	FSR11	FSR10	FSR09	FSR08

FSR2

 (Address 0C_H) Full-Scale Register

(Most Significant Byte)

 Reset Value = 55_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
FSR23	FSR22	FSR21	FSR20	FSR19	FSR18	FSR17	FSR16

DOR2

 (Address 0D_H) Data Output Register

(Most Significant Byte) (Read Only)

 Reset Value = 00_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
DOR23	DOR22	DOR21	DOR20	DOR19	DOR18	DOR17	DOR16

DOR0

 (Address 0F_H) Data Output Register

(Least Significant Byte) (Read Only)

 Reset Value = 00_H

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
DOR07	DOR06	DOR05	DOR04	DOR03	DOR02	DOR01	DOR00

ADS1243 CONTROL COMMAND DEFINITIONS

The commands listed in Table IV control the operations of ADS1243. Some of the commands are stand-alone commands (for example, RESET) while others require additional bytes (for example, WREG requires the count and data bytes).

Operands:

- n = count (0 to 127)
- r = register (0 to 15)
- x = don't care

Table 5. Command Summary

COMMANDS	DESCRIPTION	OP CODE	2nd COMMAND BYTE
	Read Data	0000 0001 (01 _H)	—
	Read Data Continuously	0000 0011 (03 _H)	—
	Stop Read Data Continuously	0000 1111 (0F _H)	—
RDATA RDATAc	Read from REG “rrrr”	0001 r r r r (1x _H)	xxxx_nnnn (# of regs-1)
STOPC RREG	Write to REG “rrrr”	0101 r r r r (5x _H)	xxxx_nnnn (# of regs-1)
WREG SELFCAL	Offset and Gain Self Cal	1111 0000 (F0 _H)	—
SELFOCAL	Self Offset Cal	1111 0001 (F1 _H)	—
SELFGCAL	Self Gain Cal	1111 0010 (F2 _H)	—
SYSOCAL	Sys Offset Cal	1111 0011 (F3 _H)	—
SYSGCAL	Sys Gain Cal	1111 0100 (F4 _H)	—
WAKEUP	Wakeup from SLEEP Mode	1111 1011 (FB _H)	—
DSYNC SLEEP	Sync \overline{DRDY}	1111 1100 (FC _H)	—
RESET	Put in SLEEP Mode	1111 1101 (FD _H)	—
	Reset to Power-Up Values	1111 1110 (FE _H)	—

NOTE: The received data format is always MSB first; the data out format is set by the BIT ORDER bit in the ACR register.

RDATA–Read Data

Description: Read the most recent conversion result from the Data Output Register (DOR). This is a 24-bit value.

Operands: None

Bytes: 1

Encoding: 0000 0001

Data Transfer Sequence:

(1) For wait time, refer to timing specification.

RDATAc–Read Data Continuous

Description: Read Data Continuous mode enables the continuous output of new data on each \overline{DRDY} . This command eliminates the need to send the Read Data Command on each \overline{DRDY} . This mode may be terminated by either the STOPC command or the RESET command. Wait at least 10 f_{OSC} after \overline{DRDY} falls before reading.

Operands: None

Bytes: 1

Encoding: 0000 0011

Data Transfer Sequence: Command terminated when “uuuu uuuu” equals STOPC or RESET.

(1)For wait time, refer to timing specification.

STOPC–Stop Continuous

Description: Ends the continuous data output mode. Issue after \overline{DRDY} goes LOW.

Operands: None

Bytes: 1

Encoding: 0000 1111

RREG–Read from Registers

Description: Output the data from up to 16 registers starting with the register address specified as part of the instruction. The number of registers read will be one plus the second byte count. If the count exceeds the remaining registers, the addresses wrap back to the beginning.

Operands: r, n

Bytes: 2

Encoding: 0001 rrrr xxxx nnnn

Data Transfer Sequence: Read Two Registers Starting from Register 01_H (MUX)

(1)For wait time, refer to timing specification.

WREG–Write to Registers

Description: Write to the registers starting with the register address specified as part of the instruction. The number of registers that will be written is one plus the value of the second byte.

Operands: r, n

Bytes: 2

Encoding: 0101 rrrr xxxx nnnn
Data Transfer Sequence: Write Two Registers Starting from 04_H (DIO)

SELFCAL–Offset and Gain Self Calibration

Description: Starts the process of self calibration. The Offset Calibration Register (OCR) and the Full-Scale Register (FSR) are updated with new values after this operation.

Operands: None

Bytes: 1

Encoding: 1111 0000

Data Transfer Sequence:

D_{IN}

SELFOCAL–Offset Self Calibration

Description: Starts the process of self-calibration for offset. The Offset Calibration Register (OCR) is updated after this operation.

Operands: None

Bytes: 1

Encoding: 1111 0001

Data Transfer Sequence:

D_{IN}

SELFGCAL–Gain Self Calibration

Description: Starts the process of self-calibration for gain. The Full-Scale Register (FSR) is updated with new values after this operation.

Operands: None

Bytes: 1

Encoding: 1111 0010

Data Transfer Sequence:

D_{IN}

SYSOCAL–System Offset Calibration

Description: Initiates a system offset calibration. The input should be set to 0V, and the ADS1243 computes the OCR value that compensates for offset errors. The Offset Calibration Register (OCR) is updated after this operation. The user must apply a zero input signal to the appropriate analog inputs. The OCR register is automatically updated afterwards.

Operands: None

Bytes: 1

Encoding: 1111 0011

Data Transfer Sequence:

D_{IN}

SYSGCAL–System Gain Calibration

Description: Starts the system gain calibration process. For a system gain calibration, the input should be set to the reference voltage and the ADS1243 computes the FSR value that will compensate for gain errors. The FSR is updated after this operation. To initiate a system gain calibration, the user must apply a full-scale input signal to the appropriate analog inputs. FCR register is updated automatically.

Operands: None

Bytes: 1

Encoding: 1111 0100

Data Transfer Sequence: D_{IN} 

WAKEUP

Description: Wakes the ADS1243 from SLEEP mode.

Operands: None

Bytes: 1

Encoding: 1111 1011

Data Transfer Sequence: D_{IN} 

DSYNC–Sync \overline{DRDY}

Description: Synchronizes the ADS1243 to an external event.

Operands: None

Bytes: 1

Encoding: 1111 1100

Data Transfer Sequence: D_{IN} 

SLEEP–Sleep Mode

Description: Puts the ADS1243 into a low power sleep mode. To exit sleep mode, issue the WAKEUP command.

Operands: None

Bytes: 1

Encoding: 1111 1101

Data Transfer Sequence: D_{IN} 

RESET–Reset to Default Values

Description: Restore the registers to their power-up values. This command stops the Read Continuous mode.

Operands: None

Bytes: 1

Encoding: 1111 1110

Data Transfer Sequence: D_{IN} A diagram showing a data transfer sequence. It consists of the label 'D_{IN}' followed by a hexagonal shape containing the binary sequence '1111 1110'.

APPLICATION INFORMATION

GENERAL-PURPOSE WEIGHT SCALE

Figure 9 shows a typical schematic of a general-purpose weight scale application using the ADS1243. In this example, the internal PGA is set to either 64 or 128 (depending on the maximum output voltage of the load cell) so that the load cell output can be directly applied to the differential inputs of ADS1243.

Figure 9. Schematic of a General-Purpose Weight Scale.

HIGH PRECISION WEIGHT SCALE

Figure 10 shows the typical schematic of a high-precision weight scale application using the ADS1243. The front-end differential amplifier helps maximize the dynamic range.

Figure 10. Block Diagram for a High-Precision Weight Scale.

DEFINITION OF TERMS

An attempt has been made to be consistent with the terminology used in this data sheet. In that regard, the definition of each term is given as follows:

Analog Input Voltage – the voltage at any one analog input relative to GND.

Analog Input Differential Voltage – given by the following equation: (IN+) – (IN–). Thus, a positive digital output is produced whenever the analog input differential voltage is positive, while a negative digital output is produced whenever the differential is negative.

For example, when the converter is configured with a 2.5-V reference and placed in a gain setting of 1, the positive full-scale output is produced when the analog input differential is 2.5 V. The negative full-scale output is produced when the differential is –2.5 V. In each case, the actual input voltages must remain within the GND to V_{DD} range.

Conversion Cycle – the term conversion cycle usually refers to a discrete A/D conversion operation, such as that performed by a successive approximation converter. As used here, a conversion cycle refers to the t_{DATA} time period.

Data Rate – The rate at which conversions are completed. See definition for f_{DATA} .

$$f_{DATA} = \frac{f_{OSC}}{128 \cdot 2^{SPEED} \cdot 1280 \cdot 2^{DR}}$$

SPEED = 0, 1
DR = 0, 1, 2

f_{OSC} – the frequency of the crystal oscillator or CMOS compatible input signal at the X_{IN} input of the ADS1243.

f_{MOD} – the frequency or speed at which the modulator of the ADS1243 is running. This depends on the SPEED bit as given by the following equation:

	SPEED = 0	SPEED = 1
mfactor	128	256

$$f_{MOD} = \frac{f_{OSC}}{mfactor} = \frac{f_{OSC}}{128 \cdot 2^{SPEED}}$$

PGA SETTING	SAMPLING FREQUENCY
1, 2, 4, 8	$f_{SAMP} = \frac{f_{OSC}}{mfactor}$
16	$f_{SAMP} = \frac{f_{OSC} \cdot 2}{mfactor}$
32	$f_{SAMP} = \frac{f_{OSC} \cdot 4}{mfactor}$
64, 128	$f_{SAMP} = \frac{f_{OSC} \cdot 8}{mfactor}$

f_{SAMP} – the frequency, or switching speed, of the input sampling capacitor. The value is given by one of the following equations:

f_{DATA} – the frequency of the digital output data produced by the ADS1243, f_{DATA} is also referred to as the Data Rate.

Full-Scale Range (FSR) – as with most A/D converters, the full-scale range of the ADS1243 is defined as the input, that produces the positive full-scale digital output minus the input, that produces the negative full-scale digital output.

For example, when the converter is configured with a 2.5-V reference and is placed in a gain setting of 2, the full-scale range is: [1.25 V (positive full-scale) minus –1.25 V (negative full-scale)] = 2.5 V.

Least Significant Bit (LSB) Weight – this is the theoretical amount of voltage that the differential voltage at the analog input has to change in order to observe a change in the output data of one least significant bit. It is computed as follows:

$$\text{LSBWeight} = \frac{\text{Full-Scale Range}}{2^N - 1}$$

where N is the number of bits in the digital output.

t_{DATA} – the inverse of f_{DATA}, or the period between each data output.

Table 6. Full-Scale Range versus PGA Setting

GAIN SETTING	5V SUPPLY ANALOG INPUT ⁽¹⁾			GENERAL EQUATIONS		
	FULL-SCALE RANGE	DIFFERENTIAL INPUT VOLTAGES ⁽²⁾	PGA OFFSET RANGE	FULL-SCALE RANGE	DIFFERENTIAL INPUT VOLTAGES ⁽²⁾	PGA SHIFT RANGE
1	5 V	±2.5 V	±1.25 V	RANGE = 0		
2	2.5 V	±1.25 V	±0.625 V	$\frac{V_{REF}}{PGA}$	$\frac{\pm V_{REF}}{2 \bullet PGA}$	$\frac{\pm V_{REF}}{4 \bullet PGA}$
4	1.25 V	±0.625 V	±312.5 mV			
8	0.625 V	±312.5 mV	±156.25 mV	RANGE = 1		
16	312.5 mV	±156.25 mV	±78.125 mV			
32	156.25 mV	±78.125 mV	±39.0625 mV			
64	78.125 mV	±39.0625 mV	±19.531 mV			
128	39.0625 mV	±19.531 mV	±9.766 mV			

(1) With a 2.5-V reference.

(2) Refer to electrical specification for analog input voltage range.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
ADS1243SJD	ACTIVE	CDIP SB	JD	20	1	TBD	AU	N / A for Pkg Type	-55 to 210	ADS1243SJD	Samples
ADS1243SKGD1	ACTIVE	XCEPT	KGD	0	121	TBD	Call TI	N / A for Pkg Type	-55 to 210		Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

CERAMIC SIDE-BRAZE DUAL-IN-LINE PACKAGE

20 PINS SHOWN

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. This package is hermetically sealed with a metal lid.
 - D. The terminals are gold plated.
 - E. Falls within MIL STD 1835 CDIP2 - T8, T14, T16, T18, T20 and T24 respectively.

重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改, 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息, 并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内, 且 TI 认为有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定, 否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险, 客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予的直接或隐含权作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息, 不能构成从 TI 获得使用这些产品或服务的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可, 或是 TI 的专利权或其它知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分, 仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时, 如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分, 则会失去相关 TI 组件或服务的所有明示或暗示授权, 且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意, 尽管任何应用相关信息或支持仍可能由 TI 提供, 但他们将独力负责满足与其产品及其应用中使用的 TI 产品相关的所有法律、法规和安全相关要求。客户声明并同意, 他们具备制定与实施安全措施所需的全部专业技术和知识, 可预见故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中, 为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此, 此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III (或类似的生命攸关医疗设备) 的授权许可, 除非各方授权官员已经达成了专门管控此类使用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同意, 对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用, 其风险由客户单独承担, 并且由客户独力负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品, 这些产品主要用于汽车。在任何情况下, 因使用非指定产品而无法达到 ISO/TS16949 要求, TI 不承担任何责任。
