

ADS7040 超低功耗、超小尺寸、8 位、1MSPS、SAR ADC

1 特性

- 业界第一款具有毫微瓦功耗的逐次逼近寄存器 (SAR) 模数转换器 (ADC):
 - 1MSPS 和 1.8V AVDD 时为 171 μ W
 - 1MSPS 和 3V AVDD 时为 555 μ W
 - 100kSPS 和 3V AVDD 时为 56 μ W
 - 1kSPS 和 3V AVDD 时低于 1 μ W
- 业界最小的 SAR ADC:
 - 采用 X2QFN-8 封装, 封装尺寸为 2.25mm²
- 1MSPS 吞吐量且零延迟
- 宽工作范围:
 - AVDD: 1.65V 到 3.6V
 - DVDD: 1.65V 至 3.6V (与 AVDD 无关)
 - 温度范围: -40°C 至 125°C
- 出色的性能:
 - 8 位分辨率且无丢码 (NMC)
 - 最大 ± 0.5 最低有效位 (LSB) 的积分非线性 (INL), 最大 ± 0.4 最低有效位 (LSB) 的差分非线性 (DNL)
 - 49dB 的信噪比 (SNR)
 - 70dB 的总谐波失真 (THD)
- 单极输入范围: 0V 至 AVDD
- 集成偏移校准
- 串行外设接口 (SPI)TM- 兼容串口: 12MHz
- 符合 JESD8-7A 标准的数字 I/O

2 应用

- 低功耗数据采集
- 电池供电类手持设备
- 液位传感器
- 超声波流量计
- 电机控制
- 可穿戴健身器
- 便携式医疗设备
- 硬盘
- 血糖仪

3 说明

ADS7040 是一款 8 位、1MSPS、模数转换器 (ADC)。该器件支持较宽的模拟输入电压范围 (1.65V 到 3.6V), 并包含一个基于电容且内置采样保持电路的逐次逼近寄存器 (SAR) ADC。串行外设接口 (SPI) 兼容串口由 \overline{CS} 和 SCLK 信号控制。输入信号在 \overline{CS} 下降沿进行采样, SCLK 用于转换和串行数据输出。此器件支持宽范围的数字电源 (1.65V 至 3.6V), 可直接连接到各类主机控制器。ADS7040 符合 JESD8-7A 标准的标称 DVDD 范围 (1.65V 至 1.95V)。

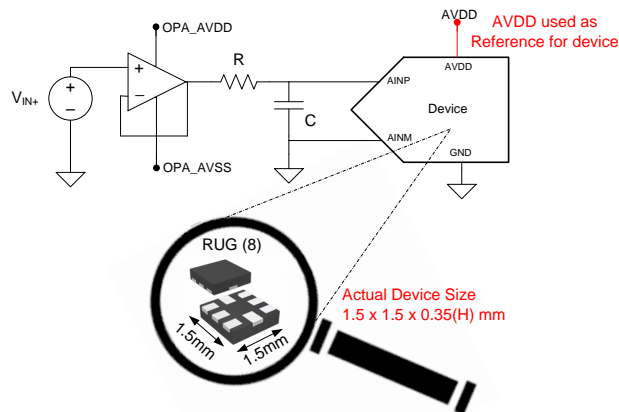

ADS7040 采用 8 引脚微型引线 X2QFN 封装, 额定工作温度范围为 -40°C 至 125°C。此器件尺寸微小且功耗极低, 非常适合空间受限类电池供电应用。

器件信息(1)

部件名称	封装	封装尺寸 (标称值)
ADS7040	X2QFN (8)	1.50mm x 1.50mm
	超薄小外形尺寸封装 (VSSOP)(8)	2.30mm x 2.00mm

(1) 要了解所有可用封装, 请见数据表末尾的可订购产品附录。

典型应用

注: ADS7040 比 0805 (2012 公制) SMD 元件小。

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision B (February 2015) to Revision C	Page
• Updated Figure 1	7
• Changed <i>Serial Interface</i> section: changed last half of first paragraph, changed Figure 35	18
• Changed Figure 38	21
• 添加了社区资源部分	32

Changes from Revision A (November 2014) to Revision B	Page
• 已更改 宽工作电压范围 特性 要点：已将 AVDD 的值从 1.8V 改为 1.65V	1
• 已更改 宽模拟输入电压范围下限至 1.65V（说明部分第 1 段）	1
• Changed <i>ESD Ratings</i> table to latest standards	5
• Changed AVDD parameter minimum specification in <i>Recommended Operating Conditions</i> table to 1.65 V	5
• Changed AVDD range in conditions of <i>Electrical Characteristics</i> table	6
• Changed INL and DNL parameter test conditions in <i>Electrical Characteristics</i> table	6
• Changed maximum throughput rate parameter test conditions in <i>Electrical Characteristics</i> table	6
• Changed AVDD parameter minimum specification in <i>Electrical Characteristics</i> table	6
• Changed conditions for <i>Timing Characteristics</i> table: changed range of AVDD and added C _{LOAD} condition	7
• Changed t _{D_CKDO} parameter in <i>Timing Characteristics</i> table	7
• Added f _{SCLK} minimum specification to <i>Timing Characteristics</i> table	7
• Changed titles of Figure 26 to Figure 30	11
• Changed <i>Reference</i> sub-section in <i>Feature Description</i> section	15
• Changed range of second f _{CLK-CAL} parameter description in Table 2	20
• Changed range of second f _{CLK-CAL} parameter description in Table 3	21
• Changed <i>Reference Circuit</i> section in <i>Application Information</i>	24
• Added last two sentences to <i>AVDD and DVDD Supply Recommendations</i> section	30

Changes from Original (November 2014) to Revision A**Page**

• 已更改产品预览数据表	1
--------------------	---

5 Pin Configuration and Functions

Pin Functions

NAME	PIN NO.		I/O	DESCRIPTION
	RUG	DCU		
AINM	8	5	Analog input	Analog signal input, negative
AINP	7	6	Analog input	Analog signal input, positive
AVDD	6	7	Supply	Analog power-supply input, also provides the reference voltage to the ADC
$\overline{\text{CS}}$	1	4	Digital input	Chip-select signal, active low
DVDD	4	1	Supply	Digital I/O supply voltage
GND	5	8	Supply	Ground for power supply, all analog and digital signals are referred to this pin
SCLK	3	2	Digital input	Serial clock
SDO	2	3	Digital output	Serial data out

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

	MIN	MAX	UNIT
AVDD to GND	−0.3	3.9	V
DVDD to GND	−0.3	3.9	V
AINP to GND	−0.3	AVDD + 0.3	V
AINM to GND	−0.3	0.3	V
Digital input voltage to GND	−0.3	DVDD + 0.3	V
Storage temperature, T _{stg}	−60	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
AVDD	Analog supply voltage range	1.65	3.6	V
DVDD	Digital supply voltage range	1.65	3.6	V
T _A	Operating free-air temperature	−40	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADS7040		UNIT
		RUG (X2QFN)	DCU (VSSOP)	
		8 PINS	8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	177.5	235.8	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	51.5	79.8	°C/W
R _{θJB}	Junction-to-board thermal resistance	76.7	117.6	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	1.0	8.9	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	76.7	116.5	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

At $T_A = -40^\circ\text{C}$ to 125°C , $AVDD = 1.65\text{ V}$ to 3.6 V , $DVDD = 1.65\text{ V}$ to 3.6 V , $f_{\text{SAMPLE}} = 1\text{ MSPS}$, and $V_{\text{AINM}} = 0\text{ V}$, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUT						
Full-scale input voltage span ⁽¹⁾			0		AVDD	V

	Maximum throughput rate	12-MHz SCLK, AVDD = 1.65 V to 3.6 V			1	MHz
DYNAMIC CHARACTERISTICS						
SNR	Signal-to-noise ratio ⁽³⁾	$f_{IN} = 2\text{ kHz}$, AVDD = 3 V	48.5	49		dB
		$f_{IN} = 2\text{ kHz}$, AVDD = 1.8 V		49		
THD	Total harmonic distortion ⁽³⁾⁽⁴⁾	$f_{IN} = 2\text{ kHz}$, AVDD = 3 V		-70		dB
SINAD	Signal-to-noise and distortion ⁽³⁾	$f_{IN} = 2\text{ kHz}$, AVDD = 3 V	48.5	49		dB
		$f_{IN} = 2\text{ kHz}$, AVDD = 1.8 V		49		
SFDR	Spurious-free dynamic range ⁽³⁾	$f_{IN} = 2\text{ kHz}$, AVDD = 3 V		75		dB
$BW_{(fp)}$	Full-power bandwidth	At -3 dB, AVDD = 3 V		25		MHz
DIGITAL INPUT/OUTPUT (CMOS Logic Family)						
V_{IH}	High-level input voltage ⁽⁵⁾		0.65 DVDD		DVDD + 0.3	V
V_{IL}	Low-level input voltage ⁽⁵⁾		-0.3		0.35 DVDD	V
V_{OH}	High-level output voltage ⁽⁵⁾	At $I_{\text{source}} = 500\ \mu\text{A}$	0.8 DVDD		DVDD	V
		At $I_{\text{source}} = 2\text{ mA}$	DVDD - 0.45		DVDD	
V_{OL}	Low-level output voltage ⁽⁵⁾	At $I_{\text{sink}} = 500\ \mu\text{A}$	0		0.2 DVDD	V
		At $I_{\text{sink}} = 2\text{ mA}$	0		0.45	
POWER-SUPPLY REQUIREMENTS						
AVDD	Analog supply voltage		1.65	3	3.6	V
DVDD	Digital I/O supply voltage		1.65	3	3.6	V
I_{AVDD}	Analog supply current	At 1 MSPS with AVDD = 3 V			185	μA
		At 100 kSPS with AVDD = 3 V			23	
		At 1 MSPS with AVDD = 1.8 V		95		
P_D	Power dissipation	At 1 MSPS with AVDD = 3 V			555	μW
		At 100 kSPS with AVDD = 3 V			56	
		At 1 MSPS with AVDD = 1.8 V		171		

(1) Ideal input span; does not include gain or offset error.

(2) LSB means least significant bit.

(3) All specifications expressed in decibels (dB) refer to the full-scale input (FSR) and are tested with an input signal 0.5 dB below full-scale, unless otherwise specified.

(4) Calculated on the first nine harmonics of the input frequency.

(5) Digital voltage levels comply with the JESD8-7A standard for DVDD from 1.65 V to 1.95 V. See the [Digital Voltage Levels](#) section for more details.

6.6 Timing Characteristics

All specifications are at $T_A = -40^{\circ}\text{C}$ to 125°C , $AVDD = 1.65\text{ V}$ to 3.6 V , $DVDD = 1.65\text{ V}$ to 3.6 V , and C_{LOAD} on SDO = 20 pF , unless otherwise specified.

		MIN	TYP	MAX	UNIT
TIMING SPECIFICATIONS					
$f_{\text{THROUGHPUT}}$	Throughput			1	MSPS
t_{CYCLE}	Cycle time	1			μs
t_{CONV}	Conversion time		$8.5 \times t_{\text{SCLK}} + t_{\text{SU_CSCK}}$		ns
$t_{\text{DV_CSDO}}$	Delay time: $\overline{\text{CS}}$ falling to data enable			10	ns
$t_{\text{D_CKDO}}$	Delay time: SCLK falling to (next) data valid on DOUT, $AVDD = 1.8\text{ V}$ to 3.6 V			30	ns
	Delay time: SCLK falling to (next) data valid on DOUT, $AVDD = 1.65\text{ V}$ to 1.8 V			50	ns
$t_{\text{DZ_CSDO}}$	Delay time: $\overline{\text{CS}}$ rising to DOUT going to 3-state	5			ns
TIMING REQUIREMENTS

7 Parameter Measurement Information

7.1 Digital Voltage Levels

The device complies with the JESD8-7A standard for DVDD from 1.65 V to 1.95 V. Figure 31 shows voltage levels for the digital input and output pins.

Figure 31. Digital Voltage Levels as per the JESD8-7A Standard

8 Detailed Description

8.1 Overview

The ADS7040 is an ultralow-power, ultra-small analog-to-digital converter (ADC) that supports a wide analog input range. The analog input range for the device is defined by the AVDD supply voltage. The device samples the input voltage across the AINP and AINM pins on the \overline{CS} falling edge and starts the conversion. The clock provided on the SCLK pin is used for conversion and data transfer. During conversions, both the AINP and AINM pins are disconnected from the sampling circuit. After the conversion completes, the sampling capacitors are reconnected across the AINP and AINM pins and the ADS7040 enters acquisition phase.

The device has an internal offset calibration. The offset calibration can be initiated by the user either on power-up or during normal operation; see the [Offset Calibration](#) section for more details.

The device also provides a simple serial interface to the host controller and operates over a wide range of digital power supplies. The ADS7040 requires only a 12-MHz SCLK for supporting a throughput of 1 MSPS. The digital interface also complies with the JESD8-7A (normal range) standard. The [Functional Block Diagram](#) section provides a block diagram of the device.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Reference

The device uses the analog supply voltage (AVDD) as a reference, as shown in [Figure 32](#). TI recommends decoupling the AVDD pin with a 1- μ F, low equivalent series resistance (ESR) ceramic capacitor. The minimum capacitor value required for AVDD is 200 nF. The AVDD pin functions as a switched capacitor load to the source powering AVDD. The decoupling capacitor provides the instantaneous charge required by the internal circuit and helps in maintaining a stable dc voltage on the AVDD pin. TI recommends powering the AVDD pin with a low output impedance and low-noise regulator (such as the [TPS79101](#)).

Figure 32. Reference for the Device

Feature Description (continued)

8.3.2 Analog Input

The device supports single-ended analog inputs. The ADC samples the difference between AINP and AINM and converts for this voltage. The device is capable of accepting a signal from -100 mV to 100 mV on the AINM input and is useful in systems where the sensor or signal-conditioning block is far from the ADC. In such a scenario, there can be a difference between the ground potential of the sensor or signal conditioner and the ADC ground. In such cases, use separate wires to connect the ground of the sensor or signal conditioner to the AINM pin. The AINP input is capable of accepting signals from 0 V to AVDD . [Figure 33](#) represents the equivalent analog input circuits for the sampling stage. The device has a low-pass filter followed by the sampling switch and sampling capacitor. The sampling switch is represented by an R_s (typically $50\ \Omega$) resistor in series with an ideal switch and C_s (typically 15 pF) is the sampling capacitor. The ESD diodes are connected from both analog inputs to AVDD and ground.

Figure 33. Equivalent Input Circuit for the Sampling Stage

The analog input full-scale range (FSR) is equal to the reference voltage of the ADC. The reference voltage for the device is equal to the analog supply voltage (AVDD). Thus, the device FSR can be determined by [Equation 1](#):

$$\text{FSR} = V_{\text{REF}} = \text{AVDD} \quad (1)$$

8.3.3 ADC Transfer Function

The device output is in straight binary format. The device resolution for a single-ended input can be computed by [Equation 2](#):

$$1\text{ LSB} = V_{\text{REF}} / 2^N$$

where:

- $V_{\text{REF}} = \text{AVDD}$ and
- $N = 8$

(2)

Feature Description (continued)

Figure 34 and Table 1 show the ideal transfer characteristics for the device.

Figure 34. Ideal Transfer Characteristics

Table 1. Transfer Characteristics

INPUT VOLTAGE (AINP – AINM)	CODE	DESCRIPTION	IDEAL OUTPUT CODE
$\leq 1 \text{ LSB}$	NFSC	Negative full-scale code	00
1 LSB to 2 LSBs	NFSC + 1	—	01
$(V_{REF} / 2)$ to $(V_{REF} / 2) + 1 \text{ LSB}$	MC	Mid code	80
$(V_{REF} / 2) + 1 \text{ LSB}$ to $(V_{REF} / 2) + 2 \text{ LSBs}$	MC + 1	—	81
$\geq V_{REF} - 1 \text{ LSB}$	PFSC	Positive full-scale code	FF

8.3.4 Serial Interface

The device supports a simple, SPI-compatible interface to the external host. The \overline{CS} signal defines one conversion and serial transfer frame. A frame starts with a \overline{CS} falling edge and ends with a \overline{CS} rising edge. The SDO pin outputs the ADC conversion results. Figure 35 shows a detailed timing diagram for the serial interface. A minimum delay of t_{SU_CSCK} must elapse between the \overline{CS} falling edge and the first SCLK falling edge. The device uses the clock provided on the SCLK pin for conversion and data transfer. The conversion result is available on the SDO pin with the first two bits set to 0, followed by 8 bits of the conversion result. The first zero is launched on the SDO pin on the \overline{CS} falling edge. Subsequent bits (starting with another 0 followed by the conversion result) are launched on the SDO pin on subsequent SCLK falling edges. The SDO output remains low after 10 SCLKs. A \overline{CS} rising edge ends the frame and brings the serial data bus to 3-state. For acquisition of the next sample, a minimum time of t_{ACQ} must be provided after the conversion of the current sample is completed. For details on timing specifications, see the [Timing Characteristics](#) table.

The device initiates an offset calibration on the first \overline{CS} falling edge after power-up and the SDO output remains low during the first serial transfer frame after power-up. For further details, refer to the [Offset Calibration](#) section.

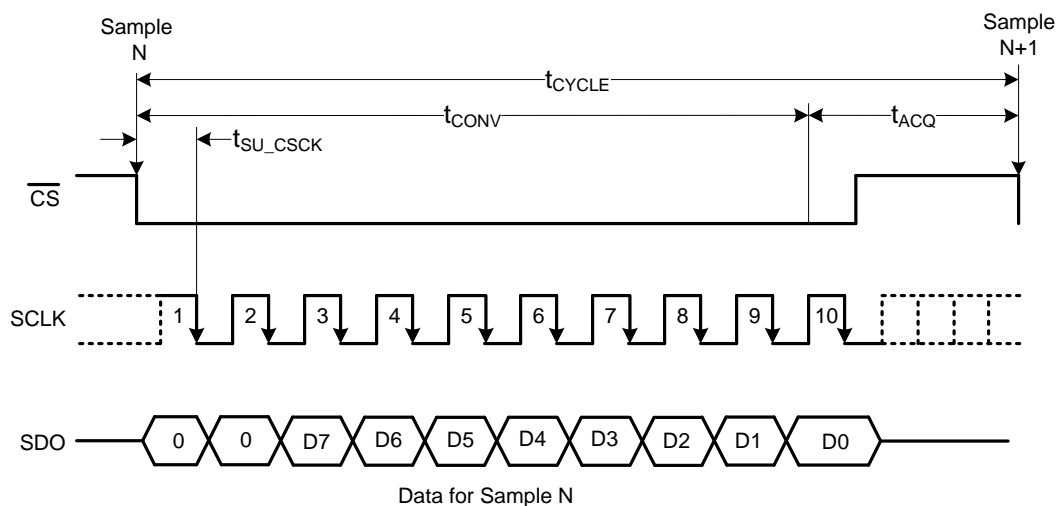

Figure 35. Serial Interface Timing Diagram

8.4 Device Functional Modes

8.4.1 Offset Calibration

The ADS7040 includes a feature to calibrate the device internal offset. During offset calibration, the analog input pins (AINP and AINM) are disconnected from the sampling stage. The device includes an internal offset calibration register (OCR) that stores the offset calibration result. The OCR is an internal register and cannot be accessed by the user through the serial interface. The OCR is reset to zero on power-up. Therefore, TI recommends calibrating the offset on power-up to bring the offset within the specified limits. If the operating temperature or analog supply voltage reflect a significant change, the offset can be recalibrated during normal operation. Figure 36 shows the offset calibration process.

- (1) See the [Timing Characteristics](#) section for timing specifications.
- (2) See the [Offset Calibration During Normal Operation](#) section for details.
- (3) See the [Offset Calibration on Power-Up](#) section for details.
- (4) The power recycle on the AVDD supply is required to reset the offset calibration and to bring the device to a power-up state.

Figure 36. Offset Calibration

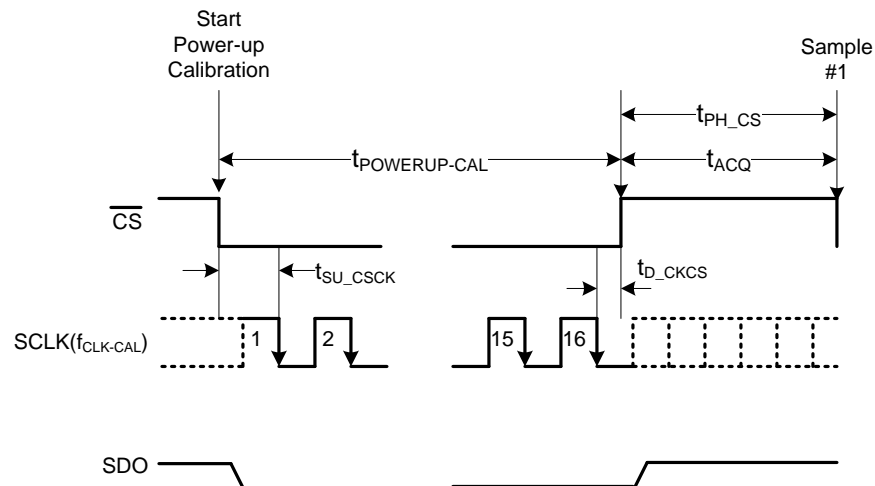

Device Functional Modes (continued)
8.4.1.1 Offset Calibration on Power-Up

The device initiates offset calibration on the first \overline{CS} falling edge after power-up and calibration completes if the \overline{CS} pin remains low for at least 16 SCLK falling edges after the first \overline{CS} falling edge. The SDO output remains low during calibration. The minimum acquisition time must be provided after calibration for acquiring the first sample. If the device is not provided with at least 16 SCLKs during the first serial transfer frame after power-up, the OCR is not updated. Table 2 provides the timing parameters for offset calibration on power-up.

For subsequent samples, the device adjusts the conversion results with the value stored in the OCR. The conversion result adjusted with the value stored in OCR is provided by the device on the SDO output. Figure 37 shows the timing diagram for offset calibration on power-up.

Table 2. Offset Calibration on Power-Up

		MIN	TYP	MAX	UNIT
$f_{CLK-CAL}$	SCLK frequency for calibration for 1.8 V < AVDD < 3.6 V			12	MHz
$f_{CLK-CAL}$	SCLK frequency for calibration for 1.65 V < AVDD < 2.25 V			12	MHz
$t_{POWERUP-CAL}$	Calibration time at power-up	15 t_{SCLK}			ns
t_{ACQ}	Acquisition time	275			ns
t_{PH_CS}	\overline{CS} high time	t_{ACQ}			ns
t_{SU_CSCK}	Setup time: \overline{CS} falling to SCLK falling	15			ns
t_{D_CKCS}	Delay time: last SCLK falling to \overline{CS} rising	10			ns

Figure 37. Offset Calibration on Power-Up Timing Diagram

8.4.1.2 Offset Calibration During Normal Operation

Offset calibration can be done during normal device operation if at least 32 SCLK falling edges are provided in one serial transfer frame. During the first 10 SCLKs, the device converts the sample acquired on the CS falling edge and provides data on the SDO output. The device initiates the offset calibration on the 17th SCLK falling edge and calibration completes on the 32nd SCLK falling edge. The SDO output remains low after the 10th SCLK falling edge and SDO goes to 3-state after CS goes high. If the device is provided with less than 32 SCLKs during a serial transfer frame, the OCR is not updated. Table 3 provides the timing parameters for offset calibration during normal operation.

For subsequent samples, the device adjusts the conversion results with the value stored in the OCR. The conversion result adjusted with the value stored in the OCR is provided by the device on the SDO output. Figure 38 shows the timing diagram for offset calibration during normal operation.

Table 3. Offset Calibration During Normal Operation

		MIN	TYP	MAX	UNIT
$f_{CLK-CAL}$	SCLK frequency for calibration for 1.8 V < AVDD < 3.6 V			12	MHz
$f_{CLK-CAL}$	SCLK frequency for calibration for 1.65 V < AVDD < 2.25 V			12	MHz
t_{CAL}	Calibration time during normal operation	15 t_{SCLK}			ns
t_{ACQ}	Acquisition time	275			ns
t_{PH_CS}	\overline{CS} high time	t_{ACQ}			ns

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The two primary circuits required to maximize the performance of a high-precision, successive approximation register (SAR), analog-to-digital converter (ADC) are the input driver and the reference driver circuits. This section details some general principles for designing the input driver circuit, reference driver circuit, and provides some application circuits designed for the ADS7040.

9.2 Typical Applications

9.2.1 Single-Supply DAQ with the ADS7040

Figure 39. DAQ Circuit: Single-Supply DAQ

9.2.1.1 Design Requirements

The goal of this application is to design a single-supply digital acquisition (DAQ) circuit based on the ADS7040 with SNR greater than 49 dB and THD less than -70 dB for input frequencies of 5 kHz at a throughput of 1 MSPS.

9.2.1.2 Detailed Design Procedure

The input driver circuit for a high-precision ADC mainly consists of two parts: a driving amplifier and an antialiasing filter. Careful design of the front-end circuit is critical to meet the linearity and noise performance of a high-precision ADC.

Typical Applications (continued)

9.2.1.2.1 Antialiasing Filter

Converting analog-to-digital signals requires sampling an input signal at a rate greater than or equal to the Nyquist rate. Any higher frequency content in the input signal beyond half the sampling frequency is digitized and folded back into the low-frequency spectrum. This process is called *aliasing*. Therefore, an external, antialiasing filter must be used to remove the harmonic content from the input signal before being sampled by the ADC. An antialiasing filter is designed as a low-pass RC filter, for which the 3-dB bandwidth is optimized for noise, response time, and throughput. For dc signals with fast transients (including multiplexed input signals), a high-bandwidth filter is designed to allow accurately settling the signal at the ADC inputs during the small acquisition time window. Figure 40 provides the equation for determining the bandwidth of the antialiasing filter.

Figure 40. Antialiasing Filter

For ac signals, the filter bandwidth must be kept low to band limit the noise fed into the ADC input, thereby increasing the signal-to-noise ratio (SNR) of the system. Besides filtering the noise from the front-end drive circuitry, the RC filter also helps attenuate the sampling charge injection from the switched-capacitor input stage of the ADC. A filter capacitor, C_{FLT} , is connected across the ADC inputs. This capacitor helps reduce the sampling charge injection and provides a charge bucket to quickly charge the internal sample-and-hold capacitors during the acquisition process. As a rule of thumb, the value of this capacitor is at least 20 times the specified value of the ADC sampling capacitance. For this device, the input sampling capacitance is equal to 15 pF. Thus, the value of C_{FLT} is greater than 300 pF. Select a COG- or NPO-type capacitor because these capacitor types have a high-Q, low-temperature coefficient, and stable electrical characteristics under varying voltages, frequency, and time.

Note that driving capacitive loads can degrade the phase margin of the input amplifiers, thus making the amplifier marginally unstable. To avoid amplifier stability issues, series isolation resistors (R_{FLT}) are used at the output of the amplifiers. A higher value of R_{FLT} is helpful from the amplifier stability perspective, but adds distortion as a result of interactions with the nonlinear input impedance of the ADC. Distortion increases with source impedance, input signal frequency, and input signal amplitude. Therefore, the selection of R_{FLT} requires balancing the stability and distortion of the design.

The input amplifier bandwidth is typically much higher than the cutoff frequency of the antialiasing filter. Thus, TI strongly recommends performing a SPICE simulation to confirm that the amplifier has more than 40° phase margin with the selected filter. Simulation is critical because even with high-bandwidth amplifiers, some amplifiers can require more bandwidth than others to drive similar filters.

Typical Applications (continued)

9.2.1.2.2 Input Amplifier Selection

Selection criteria for the input amplifiers is highly dependent on the input signal type and the performance goals of the data acquisition system. Some key amplifier specifications to consider when selecting an appropriate amplifier to drive the inputs of the ADC are:

- **Small-signal bandwidth:** Select the small-signal bandwidth of the input amplifiers to be high enough to settle the input signal in the acquisition time of the ADC. Higher bandwidth reduces the closed-loop output impedance of the amplifier, thus allowing the amplifier to more easily drive the low cutoff frequency RC filter at the ADC inputs. Higher bandwidth also minimizes the harmonic distortion at higher input frequencies. In order to maintain the overall stability of the input driver circuit, the select the amplifier bandwidth as described in [Equation 3](#).

$$GBW \geq 4 \times \frac{1}{2\pi \times R_{FLT} \times C_{FLT}}$$

where:

- GBW = unity gain bandwidth (3)
- **Noise:** Noise contribution of the front-end amplifiers must be low enough to prevent any degradation in SNR performance of the system. As a rule of thumb, to ensure that the noise performance of the data acquisition system is not limited by the front-end circuit, keep the total noise contribution from the front-end circuit below 20% of the input-referred noise of the ADC. Noise from the input driver circuit is band limited by designing a low cutoff frequency RC filter, as explained in [Equation 4](#).

$$N_G \times \sqrt{\left(\frac{V_{1/f_AMP_PP}}{6.6}\right)^2 + e_{n_RMS}^2 \times \frac{\pi}{2} \times f_{-3dB}} \leq \frac{1}{5} \times \frac{V_{REF}}{2\sqrt{2}} \times 10^{-\left(\frac{SNR(dB)}{20}\right)}$$

where:

- V_{1/f_AMP_PP} is the peak-to-peak flicker noise in $\mu VRMS$,
- e_{n_RMS} is the amplifier broadband noise,
- f_{-3dB} is the -3 -dB bandwidth of the RC filter, and
- N_G is the noise gain of the front-end circuit, which is equal to 1 in the buffer configuration. (4)
- **Settling time:** For dc signals with fast transients that are common in a multiplexed application, the input signal must settle to the desired accuracy at the inputs of the ADC during the acquisition time window. This condition is critical to maintain the overall linearity performance of the ADC. Typically, the amplifier data sheets specify the output settling performance only up to 0.1% to 0.001%, which may not be sufficient for the desired accuracy. Therefore, always verify the settling behavior of the input driver with TINA™-SPICE simulations before selecting the amplifier.

The OPA314 is selected for this application for its rail-to-rail input and output swing, low-noise ($14 \text{ nV}/\sqrt{\text{Hz}}$), and low-power ($150 \mu\text{A}$) performance to support a single-supply data acquisition circuit.

9.2.1.2.3 Reference Circuit

The analog supply voltage of the device is also used as a voltage reference for conversion. TI recommends decoupling the AVDD pin with a $1\text{-}\mu\text{F}$, low-ESR ceramic capacitor. The minimum capacitor value required for AVDD is 200 nF .

Typical Applications (continued)

9.2.1.3 Application Curve

Figure 41 shows the FFT plot for the ADS7040 with a 5-kHz input frequency used for the circuit in Figure 39.

SNR = 49.7 dB THD = -70.5 dB SINAD = 49.6 dB
 Number of samples = 32768

Figure 41. Test Results for the ADS7040 and OPA314 for a 5-kHz Input

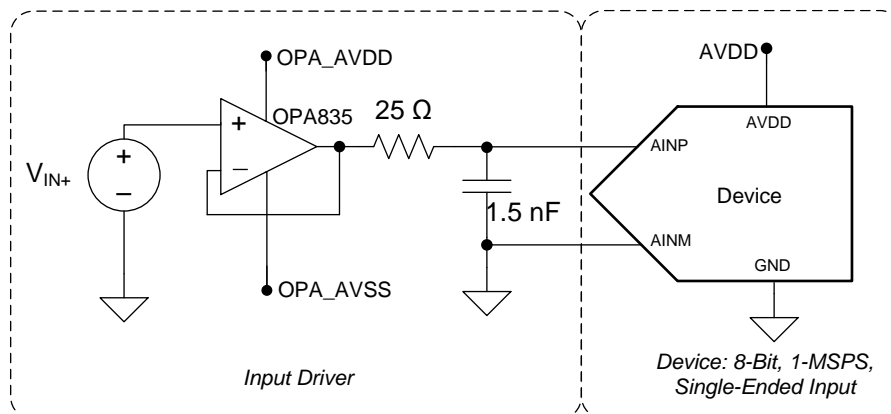

Typical Applications (continued)
9.2.2 DAQ Circuit with the ADS7040 for Maximum SINAD

Figure 42. ADS7040 DAQ Circuit: Maximum SINAD for Input Frequencies up to 250 kHz

9.2.2.1 Design Requirements

The goal of this application is to design a data acquisition circuit based on the ADS7040 with SINAD greater than 49 dB for input frequencies up to 250 kHz.

9.2.2.2 Detailed Design Procedure

To achieve a SINAD of 49 dB, the operational amplifier must have high bandwidth in order to settle the input signal within the acquisition time of the ADC. The operational amplifier must have low noise to keep the total system noise below 20% of the input-referred noise of the ADC. For the application circuit shown in [Figure 42](#), the [OPA835](#) is selected for its high bandwidth (56 MHz) and low noise (9.3 nV/ $\sqrt{\text{Hz}}$).

For a step-by-step design procedure, circuit schematics, bill of materials, PCB files, simulation results, and test results, refer to [TI Precision Design TIPD168, Three 12-Bit Data Acquisition Reference Designs Optimized for Low Power and Ultra-Small Form Factor \(TIDU390\)](#).

9.2.2.3 Application Curves

Figure 43 shows the FFT plot for the ADS7040 with a 2-kHz input frequency used for the circuit in Figure 42. Figure 44 shows the FFT plot for the ADS7040 with a 250-kHz input frequency used for the circuit in Figure 42.

9.2.3 8-Bit, 10-kSPS DAQ Circuit Optimized for DC Sensor Measurements

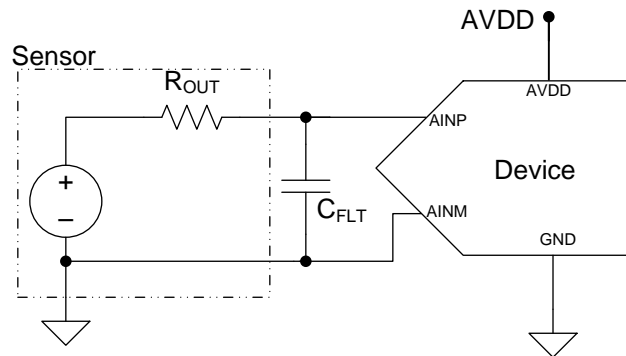

Figure 45. Interfacing the Device Directly with Sensors

In applications where the input is very slow moving and the overall system ENOB is not a critical parameter, a DAQ circuit can be designed without the input driver for the ADC. This type of a use case is of particular interest for applications in which the primary goal is to achieve the absolute lowest power possible. Typical applications that fall into this category are low-power sensor applications (such as temperature, pressure, humidity, gas, and chemical).

9.2.3.1 Design Requirements

For this design example, use the parameters listed in [Table 4](#) as the input parameters.

Table 4. Design Parameters

DESIGN PARAMETER	GOAL VALUE
Throughput	10 kSPS
SNR at 100 Hz	48.5 dB
THD at 100 Hz	65dB
SINAD at 100 Hz	48 dB
ENOB	7.5
Power	10 μ W

9.2.3.2 Detailed Design Procedure

The ADS7040 can be directly interfaced with sensors at lower throughputs without the need of an amplifier buffer. The analog input source drive must be capable of driving the switched capacitor load of a SAR ADC and settling the analog input signal within the acquisition time of the SAR ADC. However, the output impedance of the sensor must be taken into account when interfacing a SAR ADC directly with sensors. Drive the analog input of the SAR ADC with a low impedance source. The input signal requires more acquisition time to settle to the desired accuracy because of the higher output impedance of the sensor. The simplified circuit for a sensor as a voltage source with output impedance (R_{OUT}) is shown in [Figure 45](#).

The acquisition time of a SAR ADC (such as the ADS7040) can be increased by reducing throughput in the following ways:

1. Reducing the SCLK frequency to reduce the throughput, or
2. Keeping the SCLK fixed at the highest permissible value (that is, 12 MHz for the device) and increasing the CS high time.

Table 5 lists the acquisition time for the above two cases for a throughput of 100 kSPS. Clearly, case 2 provides more acquisition time for the input signal to settle.

Table 5. Acquisition Time with Different SCLK Frequencies

CASE	SCLK	t _{cycle}	CONVERSION TIME (= 8.5 × t _{SCLK} + t _{SU_CSCK})	ACQUISITION TIME (= t _{cycle} - t _{conv})
1	1.2 MHz	10 μs	7.233 μs	2.767 μs
2	12 MHz	10 μs	0.7233 μs	9.2767 μs

For a step-by-step design procedure, circuit schematics, bill of materials, PCB files, simulation results, and test results, refer to [TI Precision Design TIPD168, Three 12-Bit Data Acquisition Reference Designs Optimized for Low Power and Ultra-Small Form Factor \(TIDU390\)](#).

9.2.3.3 Application Curve

When the output impedance of the sensor increases, the time required for the input signal to settle increases and the performance of the SAR ADC starts degrading if the input signal does not settle within the acquisition time of the ADC. The performance of the SAR ADC can be improved by reducing the throughput to provide enough time for the input signal to settle. Figure 46 provides the results for ENOB achieved from the ADS7040 for case 2 at different throughputs with different input impedances at the device input.

Figure 46. ENOB (Effective Number of Bits) Achieved from the ADS7040 at Different Throughputs

Table 6 shows the results and performance summary for this 12-bit, 10-kSPS DAQ circuit application.

Table 6. Results and Performance Summary for 8-Bit, 10-kSPS DAQ Circuit for DC Sensor Measurements

DESIGN PARAMETER	GOAL VALUE	ACHIEVED RESULT
Throughput	10 kSPS	10 kSPS
SNR at 100 Hz	48.5 dB	49.55 dB
THD at 100 Hz	65dB	70 dB
SINAD at 100 Hz	48dB	49.5 dB
ENOB	7.5	7.93
Power	10 μW	6 μW

10 Power-Supply Recommendations

10.1 AVDD and DVDD Supply Recommendations

The ADS7040 has two separate power supplies: AVDD and DVDD. The device operates on AVDD; DVDD is used for the interface circuits. AVDD and DVDD can be independently set to any value within the permissible ranges. The AVDD supply also defines the full-scale input range of the device. Always set the AVDD supply to be greater than or equal to the maximum input signal to avoid saturation of codes. Decouple the AVDD and DVDD pins individually with 1- μ F ceramic decoupling capacitors, as shown in Figure 47. The minimum capacitor value required for AVDD and DVDD is 200 nF and 20 nF, respectively. If both supplies are powered from the same source, a minimum capacitor value of 220 nF is required for decoupling.

Figure 47. Power-Supply Decoupling

10.2 Estimating Digital Power Consumption

The current consumption from the DVDD supply depends on the DVDD voltage, load capacitance on the SDO line, and the output code. The load capacitance on the SDO line is charged by the current from the SDO pin on every rising edge of the data output and is discharged on every falling edge of the data output. The current consumed by the device from the DVDD supply can be calculated by Equation 5:

$$I_{DVDD} = C \times V \times f$$

where:

- C = Load capacitance on the SDO line,
- V = DVDD supply voltage, and
- f = Number of transitions on the SDO output. (5)

The number of transitions on the SDO output depends on the output code, and thus changes with the analog input. The maximum value of f occurs when data output on the SDO change on every SCLK. SDO changing on every SCLK results in an output code of AAh or 55h. For an output code of AAh or 55h at a 1-MSPS throughput, the frequency of transitions on the SDO output is 4MHz.

For the current consumption to remain at the lowest possible value, keep the DVDD supply at the lowest permissible value and keep the capacitance on the SDO line as low as possible.

10.3 Optimizing Power Consumed by the Device

- Keep the analog supply voltage (AVDD) as close as possible to the analog input voltage. Set AVDD to be greater than or equal to the analog input voltage of the device.
- Keep the digital supply voltage (DVDD) at the lowest permissible value.
- Reduce the load capacitance on the SDO output.
- Run the device at the optimum throughput. Power consumption reduces with throughput.

11 Layout

11.1 Layout Guidelines

Figure 48 shows a board layout example for the ADS7040. Use a ground plane underneath the device and partition the PCB into analog and digital sections. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the reference input signals away from noise sources. In Figure 48, the analog input and reference signals are routed on the top and left side of the device and the digital connections are routed on the bottom and right side of the device.

The power sources to the device must be clean and well-bypassed. Use 1- μ F ceramic bypass capacitors in close proximity to the analog (AVDD) and digital (DVDD) power-supply pins. Avoid placing vias between the AVDD and DVDD pins and the bypass capacitors. Connect all ground pins to the ground plane using short, low-impedance paths. The AVDD supply voltage for the ADS7040 also functions as a reference for the device. Place the decoupling capacitor (C_{REF}) for AVDD close to the device AVDD and GND pins and connect C_{REF} to the device pins with thick copper tracks, as shown in Figure 48.

The fly-wheel RC filters are placed close to the device. Among ceramic surface-mount capacitors, COG (NPO) ceramic capacitors provide the best capacitance precision. The type of dielectric used in COG (NPO) ceramic capacitors provides the most stable electrical properties over voltage, frequency, and temperature changes.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和该等应用中所用 TI 产品的功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与美国 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
