I. Features

- BU9458KV is an AAC+WMA+MP3 decoder IC in which a USB host I/F, SD memory card I/F, audio DAC and system control functions are built. Using a KEY or I2C interface command, the IC reads out a MP3 file written to a memory device having a USB I/F or a SD memory card. All the operations required before the data can be output to audio devices are incorporated into one chip.
- BU9458KV supports STAND ALONE MODE which is enabled by commands entered from the keyboard (hereinafter referred to as MODE1), AUTO SLAVE MODE which is enabled by commands entered from the master microcomputer, same as those entered from the keyboard, via the built-in I2C interface (hereinafter referred to as MODE2) and MANUAL SLAVE MODE which can send the memory device information to the master microcomputer via the I2C interface and completely control sequences such as a play sequence by the master microcomputer (hereinafter referred to as MODE3).
- ♦ BU9458KV supports fast forward playing and fast backward playing with music.
- BU9458KV outputs folder names, file names, ID3TAG (V1.0, V1.1 V2.2 V2.3 and V2.4) information and WMA-TAG information and AAC-TAG (iTunes Meta-data) information via the I2C interface. This function is enabled only in MODE 2 and MODE 3.
- BU9458KV supports audio line output, audio serial three-line (I2S) output and digital audio interface (SPDIF) output.
- ◊ Reading a specified file data is possible from USB memory. *Only a file that exists in root folder corresponds.

I.1 USB host I/F

- · Builds in the USB Full speed (12 Mbps) HOST control function.
- · Supports the USB mass storage class.
- · Does not support externally-added HUBs.

I.2 SD card I/F

- · Supports the SPI mode.
- · Supports the MMC and mini-SD cards.
- · Supports the SDHC cards.
- Supports the SD ver1.01 (file system).
- Does not support CPRM.

I.3 I2C I/F

- · Communicates with the master microcomputer using an I2C interface format.
- · Supports the standard mode (100 kbps) and fast mode (400 kbps).
- · Supports a 7-bit address.
- · Can select four types of slave addresses.

I.4 Audio output

- · 1bit-DAC output
- · Builds in the digital soft mute function.
- Supports the I2C format and digital audio interface (SPDIF) audio output.
- Builds in sound effects of POPS, JAZZ, ROCK, CLASSIC, R&B and BassBoost.* * Only audio line output is enabled.

I.5 FAT analysis

- · Supports FAT16 and FAT 32.
- · Supports VFAT (long file name).
- Supports multi-partition up to 1.
- · The maximum number of playable folders within each folder is 65534.
- The maximum number of playable files within each folder is 65534.
- The maximum number of playable folders within each device is 65534.
- The playable folder hierarchy is up to 8 layers containing the root directory.
- The playable file extension supports *.m4a for AAC, *.wma and *.asf for WMA, *.mp3, *.mp2, and *.mp1 for MP3. For *,mp2 and *.mp1, play enabled/disabled can be selected. Upper case letters and lower case letters are not distinguished in the file extension.
- · Sorts and plays up to 100 folders and 100 files in the order of UNICODE.
- · Can obtain up to 64 bytes as the folder name or file name.
- Supports 1 sector of 512, 1024, 2048 and 4096 bytes.
- · Supports up to 2G-1 bytes as the file size.

I.6 MP3 decoder

- Supports MPEG audio 1, 2 and 2.5.
- · Supports Layer 1, 2 and 3.
- · Supports sample rates 8k, 16k, 32k, 11.025k, 22.05k, 44.1k, 12k, 24k and 48kHz.
- Supports bit rate 8 to 320 kbps and VBR (Variable Bit Rate). *Except free format.
- Supports ID3TAG V1.0, V1.1, V2.2, V2.3 and V2.4.
- (Up to 64 bytes can be obtained for the names of album, artist, and title.)

I.7 WMA decoder

- · Supports Windows Media Audio 9 standard.
- · Not supports DRM.
- · Supports sample rates 8k, 16k, 32k, 11.025k, 22.05k, 44.1k, 12k, 24k and 48kHz.
- · Supports bit rate 5 to 384 kbps and VBR (Variable Bit Rate). *Except free format.
- · Supports WMA-TAG.
 - (Up to 64 bytes can be obtained for the names of album, artist, and title.)

I.8 AAC decoder

- · Supports MPEG4 AAC-LC encoded by iTunes.
- · Not supports DRM.
- · Supports sample rates 8k, 16k, 32k, 11.025k, 22.05k, 44.1k, 12k, 24k and 48kHz.
- · Supports bit rate 8 to 320 kbps and VBR (Variable Bit Rate).
- · Supports AAC-TAG(iTunes Meta-data).

(Up to 64 bytes can be obtained for the names of album, artist, and title.)

I.9 Sample rate converter

· Converts all the supported sample rates to 44.1 kHz using a poly-phase operation.

I.10 System controller

Controls all the system operations including KEY input, LED output, interface control with the master microcomputer, USB device access, SD card access, FAT analysis, sort function, MP3 decod, WMA decode e and audio output.

I.11 KEY matrix controller

Controls 12 types of KEY inputs: play/pause, stop, tune forward/fast forward playing, tune backward/fast backward playing, folder forward, folder backward, 10-tune forward, volume up, volume down, repeat play, random play and device selection.

I.12 LED controller

Controls 7 types of LED outputs: play/pause, error, memory accessing, random playing, repeat playing, USB selection and SD selection

I.13 Control from the master microcomputer

· Control from the master microcomputer is enabled using the I2C interface.

- Through the command operations, the following can be controlled: play, pause, stop, tune forward, tune backward, fast forward playing, fast backward playing, folder forward, folder backward, 10-tune forward, 10-tune backward, volume up, volume down, device selection, volume setting, repeat selection, random play, digital audio output setting, sound effect setting, resume data setting and direct tune selection data setting.
- Controls the following: playing status output, pause, stop, searching, error, folder number, file number within folder, play time information, number of total folders, number of total files, name of folder being played, name of file being played, ID3TAG (title, artist and album), WMATAG (title, artist and album), AACTAG (title, artist and album), resume data and direct tune selection data (MODE3).

I.14 Function selection

- · Selects MODE1 or MODE2/3 (SEL_SLAVE=H: MODE1, L: MODE2/3).
- Selects MPEG Audio Layer (SEL_MP3=H: play MP3 only, L: play MP1/MP2/MP3)
- · Digital audio output selection (SEL_DOUT=H: output OFF, L: output ON)
- · Sound volume operation selection (SEL_VOL=H: volume adjustable, L: volume not adjustable MAX output)
- Selects operation at power ON to check device (SEL_APLAY=H: stop, L: play). *Enabled in MODE 1 only.

- Selects MODE2 or MODE3 (SEL_SMAN=H: MODE2, L: MODE3). *Enabled in MODE 2/3 only.

I.15 File Read function in USB memory

- The specified data of file that exists in the root folder of the USB memory reading is possible.
- * The file name corresponds only by 8.3 forms. (The wild-card cannot be used.)

II. Overview

64	DVDDIO	-	-	- 1	Connect to 3.3V System Power Supply			←	

*1 When L is input, Pull-UP turns OFF.

*2 Enabled/Disabled can be selected using commands.

*3 In STAND ALONE MODE (MODE1),

When ANALOG DAC output is selected (SEL_DOUT=H), LED output is enabled.

When the Digital output is selected (SEL_DOUT=L), the I2S format audio output is enabled.

In SLAVE MODE (MODE2, MODE3),

> When the ANALOG DAC output is selected (SEL_DOUT=H), these pins are TEST terminals. When the Digital output is selected (SEL_DOUT=L), you can select I2S format audio output or digital audio interface output (SPDIF).

See Chapter V.4 for further information.

II.3 Terminal equivalent circuit diagram

III. Absolute Maximum Rating and Operating Conditions

III.1 Absolute maximum rating

(Ta=25°C)

/			
Item	Symbol	Rating	Unit
Power voltage (analog, IO)	V _{DD1MAX}	4.5	V
Terminal voltage	V _{IN}	$-0.3 \sim V_{DD1}+0.3$	V
Storage temperature range	T _{stg}	-55 ~ +125	°C
Operating temperature range	T _{opr}	-40 ~ 85	°C
Power dissipation *1	PD	750	mW

*1 When using the product at Ta= 25° C or higher temperature, 7.5 mW per 1° C should be subtracted.

III.2 Operating Conditions

Item	Symbol	Rating	Unit	Applicable terminal	
Power voltage (analog, IO)	V_{DD1}	3.0 ~ 3.6	V	DVDDIO,VDD_PLL DAVDD,AVDDC	

* Not designed to be radiation-proof.

IV. Electrical Specifications

(Ta=25°C, V_{DD1}=3.3V, V_{DD2}=1.5V, XIN_PLL=16.9344MHz unless otherwise specified.)

Item	Symbol		Speciation			Condition	
nem	Symbol	MIN.	TYP.	MAX.	Unit	Applicable terminal	
General							
Operating power consumption		_	65	80	mA	*1, When playing USE

V. I/O Signal Specifications

V.1 Clock and reset

eleen			
Signal name	I/O	Function	Remarks
XIN_PLL		X'tal (16.9344 MHz) connection input terminal	
XOUT_PLL	0	X'tal (16.9344 MHz) connection terminal	

Reset

110001			
Signal name	I/O	Function	Remarks
RESETX	Ι	System reset input terminal	

To disable a reset signal, continue L input for more than 5 us after clock input from the oscillation I/O terminal becomes stable. (See Figure V.1.)

Figure V.1 Reset Timing

Item	Symbol		Specification		Unit	Remarks
item	Symbol	min	typ	max	Onic	Remarks
Clock frequency	f _{CLK}	16.8921	16.9344	16.9767	MHz	
Reset L interval	t _{RSTX}	5	-	-	us	

V.2 SEL_SLAVE

MODE1/MODE2,	3 selection	input signal
	0.0010011011	input oignui

Signal name I/O	Function	Remarks
SEL_SLAVE I	Selects MODE1 or MODE2, 3.	H: MODE1, L: MODE2, 3

SEL_SLAVE selects MODE1 (STAND ALONE MODE) or MODE 2/3 (SLAVE MODE). By selecting SEL_SLAVE, SLAVE mode terminal setting shown in Table II.2 is enabled. SEL_SLAVE is set only at power ON. Note that change of selection after power ON is ignored.

V.3 SEL_MP3

MPEG Audio Layer 1, 2, 3 play selection signal

Signal name I/O	Function	Remarks
SEL_MP3 1		H: Can play MP3 only. L: Can play MP1, MP2 and MP3.

SEL_MP3 allows you to select the layer of the MPEG audio to be played. When enabling all the files having mp1, mp2 or mp3 as the file extension to be played, enter L. When enabling mp3 only, enter H. SEL_MP3 is set only at power ON. Note that change of election after power ON is ignored.

V.4 SEL_DOUT

Audi	io ou	tput selection signal	
Signal name	1/0	Eunction	

Signal nam		Function	Remarks	
SEL_DOU	ΓΙ	Audio output selection	H: Line output, L: I2S 3 lines serial output/SPDIF	
This SEL DOUT selects surface surface				

This SEL_DOUT selects audio output signal.

Table V4.1 "Audio output" shows the audio outputs for each MODE.

Also table V4.2 "I2S_fs" shows the I2S output formats for each MODE.

For command, see Chapter VI.

"TEST terminal" describes that this terminal is pulled-up in device.

TableV.4.1 Audio output

	MO	DE1	MODE2,3				
Pin No.	SEL DOUT=H	SEL DOUT=L	SEL DOUT=H	SEL_DOUT=L			
	SEL_DOUT-H SEL_DOUT-L		3LL_0001-11	SPDIF OFF	SPDIF ON	1	
44	Line Out Rch	HiZ	Line Out Rch	HiZ	HiŻ		
46	Line Out Lch	HiZ	Line Out Lch	HiZ	HiZ		
53	LED_ACCESS	I2S LR CLOCK	TEST terminal	12S LR CLOCK	SPDIF		
54	LED_RANDOM	12S BIT CLOCK	TEST terminal	12S BIT CLOCK	TEST terminal		
55	LED_REPEAT	I2S LRDATA	TEST terminal	I2S LRDATA	TEST terminal		

Table V.4.2 I2S_fs

MODE1	32fs
MODE2/3	Can select 32fs, 48fs, 64fs by command.

SEL_DOUT is set only at power ON. Note that change of selection after power ON is ignored.

V.5 SEL_VOL

Sound volume operation selection signal

Signal name	I/O	Function	Remarks
SEL_VOL	Ι		H: Sound volume operation enabled, L: Sound volume operation disabled

SEL_VOL selects whether sound volume operation is to be enabled or disabled.

Sound volume operation is enabled when SEL_VOL=H.

Initial value of audio output is -24.1dB at power ON.

Sound volume operation is disabled when SEL_VOL=L. Audio output is fixed to 0dB.

Figure V.5 shows the relationship between audio output and sound volume step.

SEL_VOL is set only at power ON. Note that change of selection after power ON is ignored.

Figure V.5 Volume Step Function

V.6 SEL_APLAY

Auto play selection signal at power ON/device recognition

Signal name	I/O	Function	Remarks
SEL_APLAY			H: Stop after recognizing device, H: Play after recognizing device

SEL_APLAY selects whether the audio data in the memory is to be automatically played when a memory device (USB memory or SD card) is inserted at power ON or when the system recognizes the memory device inserted.

SEL_APLAY can be selected only in MODE1. Since selection of SEL_APLAY is ignored in MODE2/3, select it from Pull-up. When MODE2/3 is selected, audio data is halted after the system recognizes a device.

V.7 SEL_UTPKT

USB test packet

00		pacitor		
Signal name	I/O	Function	Remarks	
SEL_UTPKT	Ι	USB test packet send	H: Disabled, L: USB test packet send	

A test packet signal is output from USB_DP terminal or USB_DM terminal when L is set to SEL_UTPKT at power ON.

Once enabled, SEL_UTPK keeps that state regardless of operation modes and sends out a test packet. A test packet signal is continuously output until power turns OFF. Use SEL_UTPKT when evaluating the USB terminal. In other cases, use it from Pull-up.

V.8 Audio output

Signal name	I/O	Function			Remarks
LDACO	0	Lch audio line output	-		
RDACO	0	Rch audio line output	-		

These signals are decoded MP3 music audio data line outputs. They turn ON when the line output is selected by SEL_DOUT terminal.

V.9 MUTE control output

	MUTE
Auulo	IVIUTE

Signal name	1/0	Function	Remarks
AMUTE	0	Audio mute control terminal	H: At audio output, L: At mute

This is a control terminal to mute audio output at power ON or FF/FB (silence). This terminal outputs H at audio output and L at mute. Figure V.9 shows the operation waveform.

Figure V.9 Waveform at Audio Mute

15/53

V.10 KEY input format

3x4 matrix command input

Signal name	I/O	Function	Remarks									
KEY_ROW1	Ι		-									
KEY_ROW2	Ι		-									
KEY_ROW3	Ι		-									
KEY_ROW4	Ι	KEY matrix I/O signal	-									
KEY_COL1	0		-									
KEY_COL2	0		-									
KEY_COL3	0		-									

Configure a circuit for the matrix signals terminals for KEY commands as shown in the applied circuit diagram V.10.

The operation corresponding to the key pressed over the circuit is performed. Details of each operation are explained in Chapter VI.2.

Figure V.10 KEY Matrix Applied Circuit Diagram

V.11 I2C interface format

	12C	seria	l int	erface

Signal name	I/O	Function	Remarks
SCL	I	I2C interface clock input	
SDA	1/0	I2C interface data I/O	_
A0	-	Slave address selection terminal	Slave address [0] bit setting terminal
A1		Slave address selection terminal	Slave address [1] bit setting terminal

This is an I2C serial interface terminal. By inputting L toSEL_SLAVE terminal, the interface terminal becomes enabled.

The terminal supports slave I2C operation.

V.11.1 I2C protocol

When I2C bus is in IDLE, SDA and SCL are set to H by the external Pull-up resistance. When starting communications, the master sets SDA to L while SCL is set to H (Start condition). When ending communications, the master sets SDA to H while SCL is set to H (Stop condition). Even before sending Stop condition at the end of communications, transfer of Start condition allows restart of communications (Repeated Start Condition). During transfer, SDA is changed only when SCL is set to L. Figure V.11.1 shows Start condition, Stop condition, Repeated Start condition of I2C.

Figure V.11.1 I2C start, stop, repeated start condition

V.11.2 Slave address

An I2C bus slave address corresponds to the 7-bit addressing mode. As shown in Table V.11.2, you can select the slave address using input of A0 terminal and A1 terminal. Figure V.11.2 shows the slave address transfer format.

S	A6	A5	A4	A3	A2	A1	A0	R/Ŵ	ACK
Start									
condition					sent by slave				

ACK = Acknowledge

Figure V.11.2 Slave Address Transfer Format

Table V.11.2 Settable Slave Addresses

MSB A6	A5	A4	A3	A2	A1 terminal	LSB A0 terminal
1	0	0	0	0	0	0
1	0	0	0	0	0	1
1	0	0	0	0	1	0
1	0	0	0	0	1	1

V.11.3 Write protocol from master

To send a master command using an I2C bus, follow the transfer protocol shown in Figure V.11.3. For details on each command, see Chapter VI.

Figure V.11.3 Command send protocol

V.11.4 Read protocol to master

To send reception data using a I2C bus from the slave to the master, follow the transfer protocol shown in Figure V.11.4.1 First, transfer the status read command (step1). Then, input SCL clock of required bytes in step 2 to read the status.

When the device is BUSY at reception of device status or memory data, the I2C bus may possibly be occupied by the device during BUSY. This LSI transfers the bus to the master so as not to generate such bus occupation. However, as a BUSY state still exists inside of the system, appropriate data may not be transferred during BUSY. Therefore, the first byte of transfer data (Step2) is used to judge the transfer data is enabled/disabled. When specifying addresses from the master to the slave and the first byte of the transfer data immediately after data transfer is required is 0x00, transfer data from the slave is enabled. If the first byte is 0xFF, it shows the BUSY state. Therefore, the transfer data should be disabled. If this happens, retry command transfer at Step 1 to read out the status. Figure V.11.4.2 shows the relationship between the transfer data and BUSY.

* For further information on BUSY, see Chapter V.17.

120	Jona			
Signal name	I/O	Function		Remarks
LRCK	0	I2S Bit clock output (fs=44.1kHz)		
BCK	0	I2S Bit clock output	-	
DATA	0	I2S data output	-	

This is a serial audio interface terminal. By inputting L to SEL_DOUT terminal, the interface terminal becomes enabled. When selecting the I2S serial audio output, the output format varies depending on MODE. *See Chapter V.4. MODE2 allows you to select 32fs, 48fs or 64fs. *See Chapter V.4. Figures V.12.1. V12.2 and V.12.3 show the I2S format to be output.

18/53

V.13 SPDIF format

Digital audio interface

	9.10.		
Signal name	I/O	Function	Remarks
SPDIF	0	Digital audio output	-

SPDIF output becomes enabled by setting SEL_DOUT terminal to L and setting this condition using the I2C command. *See Chapter V.4.

Figure V.13 shows the digital audio signal output format.

A sub-frame of SPDIF is composed of synchronous preamble, 16-bit audio data, V bit (validity flag), U bit (user data), C bit (channel status) and P bit (parity bit).

Output rate is fixed to 1X speed.

SPDIF outputs synchronous preamble (source code 0-3) as it is and others (source code 4-31) as bi-phase output. It outputs L while the operation is stopped.

Synchronous preamble and C bit use 32 frames (≈4.4ms) as one cycle. Table V.13.1 and Table V.13.2 show these formats. V bit is fixed to L. U bit uses 98 frames (≈13.3ms) as one cycle.

	L0	R0	L1	R1	L2	R2	L3	R3	L4	R4	L5	R5
0	В	W	М	W	М	W	М	W	М	W	М	W
1	M	W	М	W	М	¥	М	W	М	W	М	W
:		· ·	••	••	:	:	:	:	:	:	:	:
31	М	W	М	W	м	W	М	W	М	W	М	W

Table V.13.1 Synchronous Preamble Pattern

Table V.13.2	C Bit Format

١.														
		LO	R0	L1	R1	L2	R2	L3	R3	L4	R4	L5	R5	
	0	0		0 0		C	0		0		0)	
	1		0	0		1	1)	()	(0	
	2	0		0 0		0		0		0		0		
	3		0	0		1	0	0	1	()	()	
	4		0	0		0		0		0		0		
	5		0	0		0		0		0		0		
	:	:		:	:		:		:		:			
	31	0		0 0		0		0		0		()	

Confidential

	L0	R0	L1	R1	L2	R2	L3	R3	L4	R4	L5	R5
0	0	0	0	0	0	0	0	0	0	0	0	0
1	0	0	0	0	0	0	0	0	0	0	0	0
2	1	0	0	0	0	0	0	0	0	0	0	0
3	1	0	0	0	0	0	0	0	0	0	0	0
:	:	:	:	:	:	:	:	:	:	:	:	:
97	1	0	0	0	0	0	0	0	0	0	0	0

Table V.13.3 U Bit Format

P bit is set to 1 if the number of "1s" of source codes 4-30 is odd, and set to 0 if the number is even. Therefore, the number of source codes which turn to 1 for one data must be an odd value, SPDIF ends with L output and preamble output always starts in the same direction.

V.14 USB I/F

USB I/O I/F

	0 0			
Signal name	I/O	Function	Remarks	
USB_DP	I/O	USB D+I/O terminal	-	r
USB_DM	I/O	USB D-I/O terminal	-	
REXTI	()	USB bias resistance connection terminal	Connect resistance of $12k\Omega \pm 1\%$ to GND.	

Differential signals of USB_DP and USB_DM enable communications with USB devices. REXTI terminals become bias resistance connection terminals of the USB-PHY block.

V.15 SD I/F

SPI interface	for SD	memory	card I/F

Signal name	I/O	Function	Remarks
SD_CS	0	SPI chip select	-
SD_CLK	0	SPI clock	-
SD_DI	0	SPI data input	-
SD_DO	Ι	SPI data output	-
SD_CON	Ι	SD card connect detection terminal	H: Not detecting SD card connection. L: Detecting SD card connection.

These I/F enable communication with SD memory cards through SD memory card slots.

Since SD memory card slot requires to detect insertion of SD memory card, use of slot equipped with SD memory card detecting terminal and connection to SD_CON terminal are required.

SD_CON terminal is pulled up within the device and detects SD memory card connection by L input.

V.16 MCHNG

Playing sound tune number detection output

Signal name	1/0	Function	Remarks
MCHNG		Music tune number change detection output signal	H: Playing, L: Tune completed/stopped

This signal outputs change of file to be played during playing MP3 file in the memory device. MCHNG correctly outputs "H" during MP3 decode sequence, outputs "L" during "STOP" status.

V.17 BUSY

BUSY state detection output

Signal name	I/O	Function	Remarks
BUSY		BUSY state detection output signal	H: Busy, L: Not Busy

This signal outputs to indicate that this LSI is in BUSY.

BUSY signal analyzes commands from the master and outputs H until the operation is executed. This LSI ignores command input during BUSY. However, only the ABORT and STOP commands can be accepted even during BUSY, which can be executed. *See Chapter V.11.

VI. Function/Operation Explanation

VI.1 File detection

- VI.1.1 Function
 - This function supports FAT16 and FAT32 file systems. (It does not support NTFSand FAT12.)
 - · The maximum number of playable files per folder

Table VI.1.1 Maximum Number of Playable Files

	Root folder	Sub folder
FAT16	512	65534
FAT32	65536	65534

The number of files described above contains files other than AAC/WMA/MP3 and folders. If those non-AAC/WMA/MP3 files and folders exit within the folder and exceed the maximum number, all the AAC/WMA/MP3 files may not be played.

- Files less than 100 can be sorted by UNICODE in the FAT order within the folder. Files over 100 are sorted in the FAT order. Also, the folders can be sorted in the same manner and those over 100 are sorted in the FAT order.
- The searchable folder hierarchy is of 8 layers containing the root folder. Figure VI.1.1 shows an example of memory layers.

Figure VI.1.1 Example of Memory Layers

VI.1.2 Playable file

The playable file extensions are *.M4A for AAC files, *.WMA and *.ASF for WMA files, *.MP3, *.MP2 and *.MP1 for MP3 files. (Upper case letters and lower case letters are not distinguished.) Note that the file operation differs in the following cases:

- (1) SEL_MP3: See SEL_MP3 for details.
- (2) Attribute: A AAC/WMA/MP3 file whose attribute is masked can be played. A file with system attributes cannot be played.
- (3) Data destroyed file: When the data section of AAC/WMA/MP3 file is destroyed, the music data of the file can be played as much as possible rather than disabling to play the entire file. The section which cannot be played is muted. However, AMUTE terminal remains the H output level. When the header section of WMA and AAC file is destroyed, it play next.
- (4) File name: A file name and its size do not depend on playing.
- (5) Extension: When file data is configured in the non-AAC format and its file extension is *.M4A, the state is play next. When file data is configured in the non-WMA format and its file extension is *.WMA, or *.ASF, the state is play next. When file data is configured in the non-MP3 format and its file extension is *.MP3, *.MP2 or *.MP1, the state is silent playing basically. If playable data can be read, only a part of the file can be played. The information on time required to output serial status also becomes uncertain. Then, partial output is done but the correct time information is not output.
- (6) File size: When file size is "0", the file do not recognize at AAC/WMA/MP3 files.
- (7) This LSI correspond to the AAC file encoded by iTunes. The versions of iTunes checked operation are 4.*, 5.*, 6.*, and 7.0 to 7.5. The AAC file encoded with other software may cause fault, such as being in the middle of reproduction and skipping to next.
- (8) When the extension of WMA file is *.ASF, this LSI corresponds to the ASF file of only an audio stream.

VI.1.3 Playing sequence

The playing sequence of AAC/WMA/MP3 files is determined based on the following rules. See Figure VI.1.3.

(1) Folders are sorted in the order written in FAT (in the order of FAT), and files 1 to 100 are sorted in the order of UNICODE. (*See Chapter VI. 1.4.) Files over 100 are sorted in the order of FAT. Folders over 100 are sorted in the same manner.

AAC/WMA/MP3 files are sorted by AAC/WMA/MP3 following SEL_MP3. Folders are sorted including null folders and those in which AAC/WMA/MP3 files are not written. Within each folder, AAC/WMA/MP3 files over 100 and folders over 100 are played in the order written to the FAT directory entry.

Since how to write to the directory entry depends on the OS (Operating System) processing to write to the memory, you cannot understand the file playing sequence.

- (2) When a AAC/WMA/MP3 file exists in the root folder (the highest layer), the AAC/WMA/MP3 file is played first.
- (3) When all the AAC/WMA/MP3 files in the root folder have been played, those in the folder under the root folder, if any, are played.
- (4) When a folder is layered under that, AAC/WMA/MP3 files in the folder are played. When not, the master searches any other folders at the same layer and plays the one, if any.
- (5) After playing all the files, the master returns to the root folder as described in (2) and start playing with the first sorted file.

VI.1.4 Folder/file sort

Folders and files are sorted in the following sequence using this LSI.

(1) Obtain up to 100 files and 100 folders in the order written to FAT.

- (2) Compare the obtained folder/file names up to 14 characters (including filename extensions) and sort them in the ascending order.*
- (3) When the same strings are generated, follow the order written to FAT. When the same strings are generated and the extension is differrent, MP3 files is fast play.
- (4) For 101 or more folders and files, follow the order written to FAT.
- * The processing of the file name and the folder name is shown in the following.
 - 1)When the LFN(long file name) entry exists, folder/filename is processed as one character in two bytes.
 - 2)When the LFN entry doesn't exist, the SFN(short file name) entry is processed as follows.

2-a) When character-code that appears first is \geq 0x80 ,It's treated as the first byte of two byte

22/53

character. Byte data afterwards is treated as the second byte of two byte character-code, and treated by two bytes as one character.

2-b) When the case that doesn't apply to 2-a) ,that is, the character-code appears first is installed within the range of 0x00-0x7F(US-ASCII) One byte is treated as one character. '0x00' is added and enhanced to Unicode.

Please confirm the specification of the FAT filesystem about details of LFN and SFN.

Figure VI.1.3 Configurations of Folders and Files within Memory Device

18	W.mp3	within A_FOLDER, it moves to a folder
19	X.mp3	in the same layer as A_FOLDER to search MP3 files.
20	Y.mp3	Since there is no MP3 file in
21	Z.mp3	D_FOLDER, the layers same as A_FOLDER, the master plays MP3 files in E_FOLDER under that.

VI.2 MODE1

VI.2.1 KEY command operation

VI.2.1.1 KEY SCAN (Single Mode)

KEY SCAN operates in the following sequence on the circuit configuration as shown in Figure V.10. (1) KEY COL1 to 3 output waveforms at timing as shown in Figure VI.2.1.

- (1) KET_COET to 5 output wavelotins at timing as shown in Figure VI.2.1.
 (2) By pressing KEV switch KEV, DOW 4 to 4 are set to 1 at timing when KEV, COI
- (2) By pressing KEY switch, KEY_ROW 1 to 4 are set to L at timing when KEY_COL 1 to 3 are L.
 (3) When detecting L input from KEY_ROW 1 to 4 three times, the master judges that KEY has
 - been pressed. Then, the master starts the KEY operation. figure VI.2.1 KEY SCAN Waveform.

Start the operation of the pressed KEY.

VI.2.1.2 KEY SCAN (Hold Mode)

- KEY SCAN operates in the following sequence on the circuit configuration as shown in Figure V.10 .
- (1) KEY_COL1 to 3 output waveforms at timing as shown in Figure VI.2.1.
- (2) By pressing KEY switch, KEY_ROW 1 to 4 are set to L at timing when KEY_COL 1 to 3 are L.
- (3) When detecting L input from KEY_ROW 1 to 4 three times, the master judges that KEY has been pressed. Then, the master starts judging status of holded KEY.
- (4) When pressed KEY's decision (L input from KEY_ROW 1 to 4 three times) is detected consecutive 15 times, the master judges that KEY Mode is Hold Mode.
- (5) When KEY release is detected in judging status of holded KEY, the master judges that KEY Mode is Single Mode. Then, the master starts the KEY operation.
- (6) When Hold Mode is detected, the master starts the KEY operation in Hold Mode. When KEY release is detected in Hold Mode, the master finish the KEY operation.

The keys corresponding to Hold Mode are FF, FB, VOL+, and VOL-.

figure VI.2.3 KEY SCAN Waveform.

Note 1: Based on the above sequence, the master determines that KEY is pressed and starts the operation of the pressed KEY, pressing multiple KEYs at the same time will produce different operations depending on the KEY combinations. Therefore, you cannot regulate the operation sequence correctly even simultaneously pressing multiple KEYs will not cause any problems. In Hold Mode, Other pressed KEY is disregarded. Note 2: Because the KEY input does not have a buffering function, KEY inputs other than those described below are ignored.

VI.2.1.3 KEY operation

Table VI.2.1.2.1 shows the types and operations of KEYs.

Table VI.2.1.2.2 shows enabled/disabled states of KEY operations.

KEY COMMAND	OPERATION DESCRIPTION
	• When receiving "PLAY/PAUSE" key during stop, the master starts playing the first MP3 file
	sorted to the recognized device.
PLAY/PAUSE	 When receiving "PLAY/PAUSE" key during play, the master stops playing the MP3 file
FLATIFAUSE	temporarily. When receiving PLAY/PAUSE key again, the master restarts playing the file.
	temporarily. When receiving PLAT/PAOSE key again, the master restants playing the file.
	· When receiving "STOP" key during play, pause or file search, the master stops playing,
STOP	pausing or searching the MP3 file.
	\cdot When receiving "FF" KEY (Single Mode) during play or pause, the master searches the next
	AAC/WMA/MP3 file in the order of sort of files being played or paused. Upon completion of
	searching, the master starts playing the file.
	\cdot During play of the last file, the master returns to the first file in the order of sort and plays the $$
FF	file.
ГГ	· When receiving "FF" KEY (Hold Mode) during play or pause, the master starts fast forward
	playing the file. When "FF" KEY release is detected, the master return to normal playing.
	· When music finishes into "FF" KEY (Hold Mode), the master starts fast forward playing from
	top of the next file. However, when selecting "REPEAT" or "RANDOM", master search next file
	by setup.
	· When receiving "FB" KEY (Single Mode) during play or pause, the master searches the
	previous AAC/WMA/MP3 file in the order of sort of files being played or paused. Upon
	completion of searching, the master starts playing the file.
	During play of the first file, the master plays the last file in the order of sort.
	When receiving "FB" KEY within 1sec from top of file playing, the master searches the
	previous AAC/WMA/MP3 file in the order of sort of files being played. Upon completion of
FB	searching, the master starts playing the file. When receiving "FB" KEY over 1sec from top of
	file playing, the master starts playing from top of this AAC/WMA/MP3 file.
	When receiving "FB" KEY (Hold Mode) during play or pause, the master starts fast backward
	playing the file. When "FB" KEY release is detected, the master return to normal playing.
	When music finishes into "FB" KEY (Hold Mode), the master starts fast backward playing from
	end of the previous file. However, when selecting "REPEAT" or "RANDOM", master search
4	previous file by setup.
	· When receiving "FOL+" KEY during play or pause, the master searches the AAC/WMA/MP3
	files in the next folder in the order of sort of the folder in which the file being played or paused
FOL+	exists. Upon completion of search, the master plays the file.
	During play of the file in the last folder in the order of sort, the master plays the first file in the
	order of sort.
	· When receiving "FOL-" KEY during play or pause, the master searches the AAC/WMA/MP3
	files in the next folder in the order of sort of the folder in which the file being played or paused
FOL-	exists. Upon completion of search, the master plays the file.
	During play of the file in the first folder in the order of sort, the master plays the first file in the
	order of sort in the last folder.
	When receiving "+10" KEY during play or pause, the master searches AAC/WMA/MP3 files 10
	files next to the current one in the order of sort of the file being played or paused. Upon
+10	completion of search, the master starts playing the file.
	When the remaining files are less than 10 during play of the current file, the master plays the
	first file.
	· When receiving "VOL+/VOL-" KEY while SEL_VOL terminal is set to H, the master controls
	sound volume.
	· Sound volume can be controlled at 32 steps from -∞ (minimum volume) to 0dB (maximum
VOL+/VOL-	volume).
	· Since VOL+/VOL- KEY does not judge release of KEY, the master turns up or down volume
	step by step when detemining press of the KEY. Therefore, VOL KEY can be held down.

ROHM

BU9458KV	Functional	Specifications

CHNG_DEV	 The master selects the device between USB memory and SD memory card. To do this, both devices should be connected or one device should correspond to the other (USB to SD or SD to USB). Otherwise, this key operation is ignored. Stop after selecting the device at the top tune of the device. REPEAT and RANDOM settings return to the initial values. When inserting both USB Memory and SD Memory card, or neither USB Memory and SD Memory card, the master precedes USB Memory. 	
REPEAT	 This key changes the mode of repeat. Press of "REPEAT" KEY toggles like: "repeat all tunes in memory" → "repeat one tune" → "repeat within folder". When selecting "repeat within folder", the master repeats AAC/WMA/MP3 files within the folder being played. The initial setting is "repeat all tunes in memory". 	
RANDOM	 This key plays the range of ± 8 files from the current one being played in the order of sort at random. "RANDOM" KEY is enabled to change mode only during play, pause or stop.

VI.2.2 LED operation

Seven types of LEDs used to display the LSI operation states are controlled. Table VI.2.2 shows the types and states of LEDs.

Table VI.2.2	Types of LEDs and operation description
--------------	---

Types of LEDs	Operation description							
	Lights when an error occurs. This happens in the following cases:							
LED ERROR	(1) Neither USB memory or SD memory card is connected. No AAC/WMA/MP3 file							
	exists even if these devices are connected.							
	(2) Communication error or disconnection occurs in the memory being played.							
LED_PLAY	Lights during play. Blinks during pause.							
	Lights when SD memory card is connected and played.							
LED_PSD	Blinks when SD memory card is connected but SD memory card is not selected.							
	Goes off when SD memory card is not connected.							
	Lights when USB memory is connected and played.							
LED_PUSB	Blinks when USB memory is connected but USB memory card is not selected.							
	Goes off when USB memory is not connected.							
LED_ACCESS	Lights during access to USB memory or SD memory card.							
LED_RANDOM	Lights during random play.							
	Lights during folder repeat. Blinks during repeat of one tune. Goes off during repeat all							
LED_REPEAT	tunes in memory							

VI.3 MODE2

VI.3.1 Command operation

You can operate commands via the I2C serial interface. When using the LSI in MODE2, it can be operated by setting SEL_SLAVE to L. The length of command to be sent varies depending on which command is selected.

Table VI.3.1.1 shows the command specifications.

Table VI.3.1.2 shows enabled/disabled state of each command.

Table VI.3.1.1	Command Operation Description
----------------	-------------------------------

	Command		Com	mand	1	Operation description
Command name	byte length	1st	2nd	3rd	4th	
PLAY	2	0x50	0x01	-	-	 When receiving "PLAY" command during stop, the master starts playing the AAC/WMA/MP3 file currently selected. The order sorted from the root folder is initially set. When receiving "PLAY" command during pause, the master restarts playing the file from that point. When a state which disables AAC/WMA/MP3 decoding for more than 5 seconds during play, status "DECO_ERR" is set to H. MP3 decoding is continued. When receiving "PLAY" command during fast forward (or backward) playing, the master restarts normal playing the file from current point.
PAUSE			0x02	-	-	 When receiving "PAUSE" command during play, the master stops playing the AAC/WMA/MP3 files temporarily.
STOP			0x03	-	•	 When receiving "STOP" command during play, pause or file search, the master stops playing the AAC/WMA/MP3 file. When receiving "STOP" command during fast forward (or backward) playing, the master stops playing the file. "STOP" command can be received even during BUSY.
VOL+			0x04	-	-	 When SEL_VOL is set to H, "VOL+" command is enabled. When receiving "VOL+" command, the master controls sound volume. Sound volume can be controlled at 32 steps from -∞ (minimum volume) to 0dB (maximum volume).
VOL-			0x05	-	-	 When SEL_VOL is set to H, "VOL-"command is enabled. When receiving "VOL-"command, the master controls sound volume. Sound volume can be controlled at 32 steps from -∞ (minimum volume) to 0dB (maximum volume).
REPEAT			0x06		-	 This command selects the mode during repeat. REPEAT command toggles like: "repeat all tunes in memory" → "repeat one tune" → "repeat within folder". When STATUS RPT_OFF is set as ON by "REPRAND" command, REPEAT command toggles like: "all play in memory" → "one file play" → "play within folder". In this mode, it stops upon completion of playing. When selecting "repeat within folder", the master repeats AAC/WMA/MP3 files within the folder being played. The initial setting is "repeat all tunes in memory". The last setting to "REPRAND", "REPEAT" and "RANDOM" commands will be enabled.
RANDOM			0x07	-	-	 This key plays the range of ± 8 files from the current one being played in the order of sort at random. When STATUS RPT_OFF is set as ON by "REPRAND" command, REPEAT command toggles like: "one ramdom file play" → "all play with random in memory". In this mode, it stops upon completion of playing. The last setting to "REPRAND", "REPEAT" and "RANDOM" commands will be enabled.
CHNG_DEV			0x08	-	-	 The command selects the device between USB memory and SD memory card. To do this, both devices should be connected or one device should correspond to the other (USB to SD or SD to USB). Otherwise, this key operation is ignored. Stop after selecting the device at the top tune of the device. REPEAT and RANDOM settings return to the initial values.

FF 4 0x35 0x00 sort. · Operation stops upon completion of search. · When TAG analysis is set by SEL_ID3 command, operation stops upon completion of TAG analysis. 						will be enabled.			

				BUS	9458K	V Functional Specifications 32/53
			0x05	-	-	 This command plays all the tunes within the folder being played. STATUS RPT_OFF is set as ON. It stops after the last file playing within the folder. The last setting to "REPRAND", "REPEAT" and "RANDOM" commands will be enabled.
			0x06	-	-	 This command plays one tunes. STATUS RPT_OFF is set as ON. It stops after the file playing. The last setting to "REPRAND", "REPEAT" and "RANDOM" commands will be enabled.
			0x07	-	-	 This command plays through the range of ±8 files in the order of the sort from the current one being played at random. STATUS RPT_OFF is set as ON. It stops after the file playing. The last setting to "REPRAND", "REPEAT" and "RANDOM" commands will be enabled.
			0x00	-	-	 This command does not perform ID3Tag analysis written to the MP3 file. This command does not perform WMATag analysis written to the WMA file. This command does not perform AACTag analysis written to the AAC file. The file played immediately after set will be enabled first.
SEL_ID3	2	0x56	0x01	-	-	 This command analysis ID3Tag written to the MP3 file. This command analysis WMATag written to the WMA file. This command analysis AACTag written to the AAC file. The file played immediately after set will be enabled first. Upon completion of Tag analysis, the data is written to the status register.
			0x00	-	-	 This command does not perform TOC analysis. TOC analysis is not performed at initial setting.
SEL_TOC	2	0x57	0x01	-		 When receiving the command, inserting into the device or changing the device, the master analyzes the total folders (including root directory) and total AAC/WMA/MP3 files within the device. The number of total AAC/WMA/MP3 files conforms to SEL_MP3 terminal. When receiving the command, only change from OFF to ON is executed. Upon completion of TOC analysis, the master returns to the top tune of the device and stops. After TOC analysis, the data is written to the status register.
			0x00	-		This command stops 12MHz clock output from CLKOUT12 terminal.
SEL_12MOUT	2	0x58	0x01	-	-	• This command enables 12 MHz clock output from CLKOUT12 terminal.
		0.5	0x00	-	-	This command stops WDT.
SEL_WDT	2	0x5A	0x01	·	-	 This command write "1" to status STATUS WDT_RFLG.
			0x00	setting		 This command set up playtime and skiptime for fast forward playing and fast backward playing. Fast forward and fast backward playubg repeat this cycle by making {playtime(M) + skiptime(N) + error(O)} into 1 cycle. With an error, it depends on the cajoled error between the minimum decoding unit and playtime, and the real time which searchs skiptime. Errors differ by every file and every composition in memory. This command set up that playtime is M[15:0]=[4th byte, 3rd byte] and skiptime are N[15:0]=[6th byte and 5th byte]. Initial value set playtime is 200 millioned MME for the back and for the back and
SET_RPM	6	0x5B				300 mili second=M[15:0]=[4 th byte=x01, 3rd byte=x2C] and skiptime is 2100 mili second=N[15:0]=[6 th byte=x08, 5 th byte=x34]. When command set up to 0x0, setting value is initial value. The playtime should set up 300ms or more, and skiptime should set up below (playtime x16).
			0x01	setting	0x00	 This command set up the attenuation level under fast forward and backward playing. A attenuation level serves as (-6dB X [3rd byte]). A setup can be specified from 0x00 to 0x10.As for an initial value, 0x02=-12dB is set up. It becomes equivalent to MUTE by setup of 0x10.
SET_UPLOAD_ FILE1	8	0x51	0x51	NAME	E[0:5]	Specify the part of the first half of the file name of the file for File Read Function. *Bury it by 0x20 when the file name(NAME) doesn't come up to eight bytes.

SEMICONDUCTOR	BU9458KV Functional Specifications 33/53						
SET_UPLOAD_ FILE2	8	0x51	0x52	NAME EXT		Specify the part of the latter half of the file name of the file for File Read Function. *Bury it by 0x20 when the file name(NAME) doesn't come up to eight bytes. Bury it by 0x00 when the file extension doesn't come up to three bytes. It targets neither the file name comparison since 0x00 of the end in the comparison.	
UPLOAD_END	2	0x51	0x53	-	-	The File Read function is ended. Transmit after completing the file reading.

Table VI.3.1.2	Command Enabled/Disabled in Various States

O = Enabled × = Disabled

VI. 3.2 Status output

The operation information, such as internal status, play time information, folder information, file information, ID3Tag information, AACTag information and WMATag information, is output using a I2C interface.

Statuses as shown in Table VI. 3.2.1 MODE 2 Status Register Map are output.

The status register has a ring buffer structure of OFFSET 0x00-0x7F. The OFFSET position is automatically incremented after reading byte data.

Status read specifies OFFSET of the status register map. There are two methods available: to read a desired number of bytes continuously from the OFFSET position and to read the data by one command without

specifying the OFFSET position. Figure VI.3.2.2 shows the status output commands. Table VI.3.2.3 shows the enabled/disabled state of the status output commands.

Status register outputs a byte data of OFFSET 0x00-0x7F by "Little Endian" format

0x20 0x7F	COMAREA	COMAREA Data common area The content varies depending on the status read command.			

Command name	Com	mand	Status output	Status			
	1st byte	2nd byte	bytes				
READ_BUFF	0x5E	OFFSET	Optional	 The command outputs the desired bytes of data from the OFFSET position specified in the status register map. Since the status register functions as a ring buffer of 0x00-0x7F, the master returns to 0x00 after OFFSET position 0x7F during data read. 			
READ_STATUS		0x00	5	 This command outputs the data of OFFSET 0x00-0x04 in the status buffer. 			
READ_PLAY_INFO		0x01	6	 This command outputs the data of OFFSET 0x0A-0x0F in the status buffer. 			
READ_VOL		0x02	1	 This command outputs the data of OFFSET 0x05 in the status buffer. 			
READ_EQ		0x03	1	 This command outputs the data of OFFSET 0x06 in the status buffer. 			
READ_ID3_TITLE	-	0x04	64	This command outputs the data of WMATag/ID3Tag Title. *1			
READ_ID3_ARTIST		0x05	64	 This command outputs the data of WMATag/ID3Tag Artist.*1 			
READ_ID3_ALBUM		0x06	64	 This command outputs the data of WMATag/ID3Tag Album.*1 			
READ_FILE_NAME		0x07	64	This command outputs the data of playing AAC/WMA/MP3 file name. see VI.1.4			
READ_FOLDER_NAME	0x5F	0x08	64	 This command outputs the data of folder name includes playing AAC/WMA/MP3 file. see VI.1.4 			
READ_RESUME_INFO * See Chapter VI.3.4.		0x09	42	This command outputs the data to resume. see VI.3.4			
READ_VERSION		0x10	1	This command outputs the data of Firmware version.			
READ_FILE_SIZE		0x11	4	 The size of a specified file of the File Read function is acquired. It outputs it with LittleEndian. When the file doesn't exist, "0xFF, 0xFF, 0xFF, and 0xFF" is output. 			
READ_FILE_DATA		0×12	96	 The file data of a specified file of the File Read function is read. The 92byte data reading is possible by one time. Four head bytes are file offsets. It outputs it with LittleEndian. 			

*1 : BOM(Byte Order Mark) might enter two head bytes according to ID3 data

	After recognizing device (stopping after searching)	During play of device	Searching	Error
READ_BUFF	0	0	0	0

READ_FILE_DATA	halt condition	is the cor	nmand effec	tive.

Table VI.3.2.3 Command Enabled/Disabled in Various States

 O = Enabled, \times = Disabled

VI.3.3 Equalizer

You can select 5 types of equalizer and 2 types of BassBoost for the audio line output using a command (see Table VI. 3.3.1). Combination of equalizer and BassBoost1 is available.

Equalizer setting is enabled even when line output is not selected. No change of sound quality by the equalizer is found in digital outputs.

Figures VI.3.3.1 to VI. 3.3.6 show the frequency characteristics of each filter.

Figure IV.3.3.1 POPS Frequency Characteristics

41/53

VI. 3.4 Resume information

This LSI outputs the information required to implement the resume function using the "READ_RESUME_INFO" command.

Table VI.3.4 shows the resume information status register structure.

Table VI. 3.4 Resume Information Register Structure

Status OFFSET	Resume information
	Resume Information data [42 bytes]

i. Resume Information data :

Shows the file's information and play's information now.

This is a number uniquely set to the LSI.

Since the above 42-byte resume information is used to execute resume play, do not change the contents before use. When you use changed contents, the action cannot assure.

You can implement the resume function by reading the resume information read using the "READ_RESUME_INFO" command and then writing the information using the "SET_RESUME_INFO1-7" command. After "SET_RESUME_INFO1-7" is all written, the LSI automatically searches and plays a resume file from the time, which read "READ_RESUME_INFO" command upon completion of writing of "SET_RESUME_INFO7".

VI. 3.5 Language Code Information

This LSI outputs Language Code Information to Status register. (OFFSET=0x1C and 0x1D) Table VI.3.5 shows the Language Code information status register structure.

LANGH OFFSET=0x1D	LANGL OFFSET=0x1C	Language Code
0x00	0x00	ID3V1 TAG or ISO8859-1 (ID3V2 TAG)
0x00	0x01	UTF-16 (ID3V2 TAG)
0x00	0x02	UTF-16BE (ID3V2 TAG)
0x00	0x03	UTF-8 (ID3V2 TAG or AAC TAG iTunes Meta-data)
0x00	0x49	UTF-16LE (WMA TAG)

 Table VI. 3.5
 Language Code Information Register Structure

43/53

VI.4 MODE3

MODE3 specifies and plays the AAC/WMA/MP3 file to be played by the master microcomputer by outputting the AAC/WMA/MP3 file/folder status information, written to USB memory or SD memory card, to the master microcomputer.

VI.4.1 Command operation

The LSI sends commands to obtain the file/folder information in USB memory or SD memory card, to analyze ID3Tag, to analyze WMATag, to analyze AACTag, and to set a file to be played and start playing it. Table VI.4.1 shows the commands available in MODE3. When sending a command other than listed below in MODE3, it is ignored.

	Command		Com	mand	Operation description		
Command name	byte length	1st	2nd	3rd - 6th			
PAUSE	2	0x50	0x02	-	 When receiving "PAUSE" command during play, the master stops playing the AAC/WMA/MP3 files temporarily. 		
STOP			0x03	-	 This command stops the operations of TAG analysis. This command stops playing the AAC/WMA/MP3 file and stop at to of this AAC/WMA/MP3 file. 		
VOL+			0x04	-	 When SEL_VOL is set to H, "VOL+" command is enabled. When receiving "VOL+" command, the master controls sound volume. Sound volume can be controlled at 32 steps from -∞ (minimum volume) to 0dB (maximum volume). 		
VOL-			0x05		 When SEL_VOL is set to H, "VOL-"command is enabled. When receiving "VOL-"command, the master controls sound volume. Sound volume can be controlled at 32 steps from -∞ (minimum volume) to 0dB (maximum volume). 		
CHNG_DEV			0x08	-	 The command selects the device between USB memory and SD memory card. To do this, both devices should be connected or one device should correspond to the other (USB to SD or SD to USB). Otherwise, this command is ignored. After selecting the device, the LSI waits for a command. 		
GET_DIRECT			0x09	_	 This command obtains the folder information (*see VI.4.3) and file information (*see VI.4.3) for the folder set by SET_DIRECT. Read the information using the status commands "READ_FOLDER_INFO" and "READ_FILE_INFO". The status of "ANA_END", "FOLINF", "FILINF", "FOLFULL" and "FILFULL" are reset. 		
GET_NUMBER	5		0x0A	-	 This command obtains the number of files and folders for the folder set by SET_DIRECT. Read the information using status command "READ_NUMBER". The number of non-AAC/WMA/MP3 files is ignored. The statuses of "ANA END" is reset. 		
GET_ID3			0x0B	-	 This command performs TAG analysis for the valid file set by SET_DIRECT. The command also analyzes even if the folder is not specified. However, at the end of analysis, a status in which Tag information is not contained will be output. The statuses of "ID3READY", "ID3RSID1" and "ID3RSID2" are reset 		
ABORT			0x0C	-	 This command stops the operations of Tag analysis, folder analysis and file analysis. The statuses of "ANA_END", "FOLINF", "FILINF", "FOLFULL", "FILFULL", "ID3READY", "ID3RSID1" and "ID3RSID2" are reset. 		

Table VI.4.1 MODE3 Command

SEMICONDUCTOR			E	3U945	8KV F	Functional Specifications 44/53		
PLAY_DIRECT			0x0D		-	 This command starts playing the AAC/WMA/MP3 file set by SET_DIRECT. The command plays the file even when the preset file is not a AAC/WMA/MP3 file or when the folder is specified, the command plays the specified one. If AAC/WMA/MP3 decode disabled is detected for 5 seconds or longer, the command outputs status "DECO_ERR"=H. 		
					0x58	 This command outputs audio data in the I2S (32fs) format. When line output is selected by SEL_DOUT terminal, the command is ignored. This command outputs audio data in the I2S (48fs) format. 		
				0x00	0x59	 When line output is selected by SEL_DOUT terminal, the command is ignored. 		
SET_DOUT	4		0x20		0x5B	 This command outputs audio data in the I2S (64fs) format. When line output is selected by SEL_DOUT terminal, the command is ignored. 		
		0x51		0x01	0x01	 This command performs serial audio interface (SPDIF)output. When line output is selected by SEL_DOUT terminal, the command is ignored. 		
				0xFF	0x00	 This command performs serial audio interface (I2S, SPDIF) output. When line output is selected by SEL_DOUT terminal, the command is ignored. 		
SET_NUMBER	6		0x21	0xXX		0xXX		 This command sets the number of obtained folders for those set by SET_DIRECT. Parameter: "Number of obtained folders: 2 bytes" + "Number of obtained AAC/WMA/MP3 files: 2 bytes". By specifying "0", all the folders and files are obtained.
SET_RESUME_ INFO1			0x41	RESUME INFO 1byte-6byte		• This command sets byte 1 to 6 of 42-byte data obtained by "READ_RESUME_INFO".		
SET_RESUME_ INFO2			0x42	RES IN	UME	• This command sets byte 7 to 12 of 42-byte data obtained by "READ_RESUME_INFO".		
SET_RESUME_ INFO3			0x43	RES IN 13byte	UME FO =-18byt	• This command sets byte 13 to 18 of 42-byte data obtained by		
SET_RESUME_ INFO4	8	0x51	0x44	IN 19byte	UME FO 24byt	 This command sets byte 19 to 24 of 42-byte data obtained by "READ_RESUME_INFO". 		
SET_RESUME_ INFO5			0x45	RES IN 25byte	UME FO 30byt e	 This command sets byte 25 to 30 of 42-byte data obtained by "READ_RESUME_INFO". 		
SET_RESUME_ INFO6	5		0x46	RES IN 31byte	UME FO 36byt e	 This command sets byte 31 to 36 of 42-byte data obtained by "READ_RESUME_INFO". 		
SET_RESUME_ INFO7			0x47	IN 37byte	UME FO :-42byt e	 This command sets byte 37 to 42 of 42-byte data obtained by "READ_RESUME_INFO". Do not begin playback by this command in MODE3. 		
SET_EQ	2	0x52	0x00		-	This command turns OFF EQ setting.

			0x04	· ·	-	· CLASSIC		
			0x05		-	· R&B		

			E	3U945	8KV F	Functional Specifications 45/53
			0x07		-	 This command turns OFF EQ setting.
			0x08	-		· BASS BOOST
			0x09		-	· POPS+BASS
			0x0A	-		· JAZZ+BASS
			0x0B		-	· ROCK+BASS
			0x0C		-	· CLASSIC+BASS
			0x0D		-	· R&B+BASS
			0x0F		-	· BASS BOOST2
SET_VOL		0x53	Setting value		-	 Set sound volume the second byte value of the command. The setting values are 32 steps ranging from 0x00 to 0x1F. A value specified outside the above range will be ignored.
FFP_ON			0.01	0x02	0x00	. Start the fast-forwarding playback from a present playback position by this command of playbacking and pausing.
FFP_OFF		0.55	0x01	0×03	0x00	. Stop the fast-forwarding playback by this command fast-forwarding playback, and usually playback.
FBP_ON	4	0x55		0x02	0x00	. Start the rewinding playback from a present playback position by this command of playbacking and pausing.
FBP_OFF			0x02	0x03	0x00	. Stop the rewinding playback by this command rewinding playback, and usually playback.
			0x00		-	 This command stops 12 MHz clock output from CLKOUT12 terminal.
SEL_12MOUT	2	0x58	0x01		-	 This command enables 12 MHz clock output from CLKOUT12 terminal.
SET_DIRECT	8	0x59	0x00	0xXX		 This command specifies the current position of the folder/file by specifying the folder/file information access data (6 bytes). Specify access data (6 bytes) at 0xXX.
		0.45.4	0x00			 By specifying "0", the position is set to the root folder. This command stops Watch Dog Timer.
SET_WDT	2	0x5A	0x01	-		 This command write "1" to status STATUS WDT_RFLG.
						 This command set up playtime and skiptime for fast forward playing and fast backward playing. Fast forward and fast backward playubg repeat this cycle by making {playtime(M) + skiptime(N) +error(O)} into 1 cycle. With an error, it depends on the cajoled error between the minimum decoding unit and playtime, and the real time which searchs skiptime. Errors differ by every file and every composition in memory.
SET_RPM	6	0x5B	0×00	set	ting	 This command set up that playtime is M[15:0]=[4th byte, 3rd byte] and skiptime are N[15:0]=[6th byte and 5th byte]. Initial value set playtime is 300 mili second=M[15:0]=[4 th byte=x01, 3rd byte=x2C] and skiptime is 2100 mili second=N[15:0]=[6 th byte=x08, 5 th byte=x34]. When command set up to 0x0, setting value is initial value.
					1	The playtime should set up 300ms or more, and skiptime should set up below (playtime x16).
SET_RPM	6	0x5B	0x01	setting	0x00	 This command set up the attenuation level under fast forward and backward playing. A attenuation level serves as (-6dB X [3rd byte]). A setup can be specified from 0x00 to 0x10.As for an initial value, 0x02=-12dB is set up. It becomes equivalent to MUTE by setup of 0x10.
SET_UPLOAD_FIL E1	8	0x51	0x51	NAM	E[0:5]	Specify the part of the first half of the file name of the file for File Read Function. *Bury it by 0x20 when the file name(NAME) doesn't come up to eight bytes.
SET_UPLOAD_FIL E2	8	0×51	0×52	NAME[6:7] EXT[0:2]		 Specify the part of the latter half of the file name of the file for File Read Function. *Bury it by 0x20 when the file name(NAME) doesn't come up to eight bytes. Bury it by 0x00 when the file extension doesn't come up to three bytes. It targets neither the file name comparison since 0x00 of the end in the comparison.

Table VI. 4.2 Command Enabled/Disabled in Various Status

 $O = Enabled \times = Disabled$

VI.4.2 Status output

The LSI outputs the operation information, such as internal status, play time information, folder information, file information ID3Tag information, AACTag information, and WMATag information, using the I2C interface. The statuses as shown in Table VI.4.2.1 MODE3 status register map are output. There are two methods available: to read a desired number of bytes continuously from the OFFSET position and to read the data by one command without specifying the OFFSET position. Figure VI.4.2.2 shows the status output commands. Table VI.4.2.3 shows the enabled/disabled state of the status commands.

The status register has a ring buffer structure of OFFSET 0x00-0x7F. The OFFSET position is automatically incremented after reading byte data.

Status register outputs a byte data of OFFSET 0x00-0x7F by "Little Endian" format

READ_FOLDER_NAME		0x08	64	 This command outputs the data of folder name includes playing AAC/WMA/MP3 file. see VI.1.4 	
READ_RESUME_INFO	0x5F	0x09	42	 Acquire RESUME information in this command while being playbacking or pausing. Set the data acquired in this command as it is when setting RESUME information by "SET_RESUME_INFO1-7". 	
READ_NUMBER	UXOF	0x0A	4	This command outputs OFFSET 0x10-0x13 of status buffer.	
READ_REST_NUM		0x0B	4	This command outputs OFFSET 0x14-0x17 of status buffer.	
READ_SET_NUM		0x0C	4	 This command outputs OFFSET 0x18-0x1B of status buffer. 	
READ_FOLDER_INFO		0x0D	76	 This command outputs the result of folder analysis by "GET_DIRECT" command. see VI.4.3. 	
READ_FILE_INFO		0x0E	76	 This command outputs the result of file analysis by "GET_DIRECT" command. see VI.4.3. 	
READ_CLAS		0x0F	4	• This command outputs the data of file cluster number. Use to check file when "PLAY_DIRECT".	
READ_VERSION		0x10	1	 This command outputs the data of Firmware version. 	
READ_FILE_SIZE		0x11	4	 The size of a specified file of the File Read function is acquired. It outputs it with LittleEndian. When the file doesn't exist, "0xFF, 0xFF, 0xFF, and 0xFF" is output. 	
READ_FILE_DATA		0x12	96	 The file data of a specified file of the File Read function is read. The 92byte data reading is possible by one time. Four head bytes are file offsets. It outputs it with LittleEndian. 	

*1:BOM(Byte Order Mark) might enter two head bytes according to ID3 data

	After recognizing device	Analyzing	During play of device	Searching	Error	
READ_BUFF	0	0	0	0	0	
READ_STATUS	0	0	0	0	0	
READ_PLAY_INFO	0	×	0	×	O*	
READ_VOL	0	×	0	×	0	
READ_EQ	0	×	0	×	0	
READ_ID3_TITLE	0	×	0	×	×	
READ_ID3_ARTIST	0	×	0	×	×	
READ_ID3_ALBUM	0	×	0	×	×	
READ_FILE_NAME	0	×	0	×	×	
READ_FOLDER_NAME	0	×	0	×	×	
READ_RESUME_INFO	0	×	0	×	×	
READ_NUMBER	0	×	×	×	×	
READ_REST_NUM	0	×	×	×	×	
READ_SET_NUM	0	×	×	×	×	
READ_FOLDER_INFO	0	×	×	×	×	
READ_FILE_INFO	0	×	×	×	×	
READ_CLAS	0	×	×	×	×	
READ_VERSION	0	×	×	×	×	
READ_FILE_SIZE	After recognizing the USB memory, only the halt			halt		
READ_FILE_DATA	condition is the command effective.					

Table VI.4.2.3

 $O = Enabled \times = Disabled$

*"READ_PLAY_INFO" command when an error occurs can be received. However, status output may not send correct data.

VI.4.3 Folder information/File information

For analysis performed by "GET_DIRECT" command, read 76 bytes from the status register "COMAREA (0x20-0x6B)" using status commands "READ_FOLDER_INFO" and "READ_FILE_INFO".Each of the status register structures when "READ_FOLDER_INFO" and "READ_FILE_INFO" are sent is shown below.

(1) Folder information

When the folder is specified using "SET_DIRECT", the LSI allows you to fetch the folder information in the specified folder from the memory device at "GET_DIRECT" and read folder information using "READ_FOLDER_INFO".

Table VI.4.3.1 shows the status register structure.

Status OFFSET	Folder information		
0x20-0x25	Access data [6 bytes]		
0x26-0x27	Reserve [2 bytes]		
0x28-0x2B	Cluster number [4 bytes]		
0x2C-0x6B	Folder name [64 bytes]		

Access data : Shows the position where the folder information is written in the memory. i.

ii. Reserve : All "0s" are output.

- iii.
 - Cluster number : Shows the cluster number where the folder information is written in the memory.
 - Folder name : Outputs the folder name from the leftmost position.

(2) File information

iv.

When the folder is specified using "SET DIRECT", the LSI allows you to fetch the file information in the specified folder from the memory device at "GET_DIRECT" and read file information using "READ FILE INFO".

Table VI.4.3.2 shows the status register structure.

		10010 11.4.0.2		
		Status OFFSET	File information	
		0x20-0x25	Access data [6 bytes]	
		0x26	Judge WMA file[1 bytes]	
		0x27	Reserve [1bytes]	
		0x28-0x2B	Cluster number [4 bytes]	
		0x2C-0x6B	File name [64 bytes]	
i.	Access data :	Shows the po	sition where the file information is wri	tten in the memory.
ii.	Judge WMA file :	Output "0" wh	nen play MP3 file, output "1" when pl	ay WMA file, output "2" when play
	-	AAC file.		
iii.	Reserve :	All "0s" are ou	itput.	

Table VI.4.3.2 File Information Register Structure

- All "Us" are output.
- Cluster number: Shows the cluster number where the file information is written in the memory. iv.
 - : Outputs the file name from the leftmost position. File name

VI. 4.4 Language Code Information

This LSI outputs Language Code Information to Status register. (OFFSET=0x1C and 0x1D) See Chapter VI. 3.5.

V.

VI.5 Watchdog Timer

This system builds Watchdog timer(WDT) function.

After RESET, WDT function is enabled on MODE1, MODE2 and MODE3. WDT is enabled always on MODE1. On MODE2 and MODE3, WDT function can disable by command "SET_WDT"(0x5A,0x00). After WDT function is disabled, this function cannot enable until a reset from external pin.

When WDT function is enabled and system is hang-up, Watchdog Timer function generates RESET.

When you want to watch RESET of WDT from master micon, write command "SET_WDT"(0x5A,0x01). After write command "SET_WDT"(0x5A,0x01), status "WDT_RFLG" is "1".

"WDT_RFLG" is bit6 of STATUS5(offset;x04). This status is "0" after RESET. Therefore, when this status returned to "0" from "1", this system generated a reset.

VII. Revision history

Revision No.	Date	Revised by	Revising points
Target0.01	2009/02/02	H.K.	Initial release
Target0.02	2009/05/28	H.K.	The explanation addition of resume and fast forward playing and fast backward playing by MODE3. File Read functional explanation addition.
