

12-Bit Octal-Channel ADC Family Up to 65MSPS

Check for Samples: [ADS5281](#), [ADS5282](#)

FEATURES

- **Speed and Resolution Grades:**
 - **ADS5281: 12-bit, 50MSPS**
 - **ADS5282: 12-bit, 65MSPS**
- **Power Dissipation:**
 - **48mW/Channel at 30MSPS**
 - **55mW/Channel at 40MSPS**
 - **64mW/Channel at 50MSPS**
 - **77mW/Channel at 65MSPS**
- **70dBFS SNR at 10MHz IF**
- **Analog Input Full-Scale Range: $2V_{PP}$**
- **Low-Frequency Noise Suppression Mode**
- **6dB Overload Recovery In One Clock**
- **External and Internal (Trimmed) Reference**
- **3.3V Analog Supply, 1.8V Digital Supply**
- **Single-Ended or Differential Clock:**
 - **Clock Duty Cycle Correction Circuit (DCC)**
- **Programmable Digital Gain: 0dB to 12dB**
- **Serialized DDR LVDS Output**
- **Programmable LVDS Current Drive, Internal Termination**
- **Test Patterns for Enabling Output Capture**
- **Straight Offset Binary or Two's Complement Output**
- **Package Options:**
 - **9mm × 9mm QFN-64**
 - **HTQFP-80 PowerPAD™ Compatible with [ADS527x](#) Family**

APPLICATIONS

- **Medical Imaging**
- **Wireless Base-Station Infrastructure**
- **Test and Measurement Instrumentation**

DESCRIPTION

The ADS528x is a family of high-performance, low-power, octal channel analog-to-digital converters (ADCs). Available in either a 9mm × 9mm QFN package or an HTQFP-80 package, with serialized low-voltage differential signaling (LVDS) outputs and a wide variety of programmable features, the ADS528x is highly customizable for a diversity of applications and offers an unprecedented level of system integration. An application note, XAPP774 (available at www.xilinx.com), describes how to interface the serial LVDS outputs of TI's ADCs to Xilinx® field-programmable gate arrays (FPGAs). The ADS528x family is specified over the industrial temperature range of -40°C to $+85^{\circ}\text{C}$.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments, Inc.

Xilinx is a registered trademark of Xilinx, Inc.

All other trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2006–2012, Texas Instruments Incorporated

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

- (1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
- (2) These devices meet the following planned eco-friendly classification:
Green (RoHS and No Sb/Br): Texas Instruments defines *Green* to mean Pb-free (RoHS compatible) and free of bromine (Br)- and antimony (Sb)-based flame retardants. Refer to the [Quality and Lead-Free \(Pb-Free\) Data](#) web site for more information. These devices have a Cu NiPdAu lead/ball finish.
- (3) Refer to the Package Option Addendum at the end of this document for specific transport media and quantity information.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Over operating free-air temperature range, unless otherwise noted.

	ADS528x	UNIT
Supply voltage range, AVDD	–0.3 to +3.9	V
Supply voltage range, LVDD	–0.3 to +2.2	V
Voltage between AVSS and LVSS	–0.3 to +0.3	V
External voltage applied to REF _T pin	–0.3 to +3	V
External voltage applied to REF _B pin	–0.3 to +2	V
Voltage applied to analog input pins	–0.3 to minimum [3.6, (AVDD + 0.3)]	V
Voltage applied to digital input pins	–0.3 to minimum [3.9, (AVDD + 0.3)]	V
Peak solder temperature	+260	°C
Junction temperature	+125	°C
Storage temperature range	–65 to +150	°C

- (1) Stresses above these ratings may cause permanent damage. Exposure to *absolute maximum conditions* for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.

RECOMMENDED OPERATING CONDITIONS⁽¹⁾

PARAMETER		ADS528x			UNIT
		MIN	TYP	MAX	
SUPPLIES, ANALOG INPUTS, AND REFERENCE VOLTAGES					
AVDD	Analog supply voltage	3.0	3.3	3.6	V
LVDD	Digital supply voltage	1.7	1.8	1.9	V
	Differential input voltage range		2		V _{PP}
	Input common-mode voltage		V _{CM} ± 0.05		V
REF _T	External reference mode		2.5		V
REF _B	External reference mode		0.5		V
CLOCK INPUTS					
	ADCLK input sample rate 1/ t _C	10		50, 65	MSPS
	Input clock amplitude differential (V _{CLKP} –V _{CLKN}) peak-to-peak				
	Sine wave, ac-coupled		3.0		V _{PP}
	LVPECL, ac-coupled		1.6		V _{PP}
	LVDS, ac-coupled		0.7		V _{PP}
	Input clock CMOS, single-ended (V _{CLKP})				
	V _{IL}			0.6	V
	V _{IH}	2.2			V
	Input clock duty cycle		50		%
DIGITAL OUTPUTS					
	ADCLK _P and ADCLK _N outputs (LVDS)	10	1x (sample rate)	50, 65	MHz
	LCLK _P and LCLK _N outputs (LVDS)	60	6x (sample rate)	300, 390	MHz
C _{LOAD}	Maximum external capacitance from each pin to LVSS		5		pF
R _{LOAD}	Differential load resistance between the LVDS output pairs		100		Ω
T _A	Operating free-air temperature	–40		+85	°C

(1) All conditions are common to the ADS528x family.

INITIALIZATION REGISTERS

After the device has been powered up, the following registers must be written to (in the exact order listed below) through the serial interface as part of an initialization sequence.⁽¹⁾

	ADDRESS (hex)	DATA (hex)
Initialization Register 1 ⁽¹⁾	03	0002
Initialization Register 2 ⁽¹⁾	01	0010
Initialization Register 3 ⁽¹⁾	C7	8001
Initialization Register 4 ⁽¹⁾	DE	01C0

(1) It is no longer necessary to write these initialization registers. However, customers who have already included them in their software can continue to use them. Programming these registers does not affect device performance.

If the analog input is ac-coupled, the following registers must be written to in the order listed below.

	ADDRESS (hex)	DATA (hex)
Initialization Register 1	01	0010
Initialization Register 5	E2	00C0

To disable the PLL configuration switching (especially useful in systems where a system-level timing calibration is done once after power-up), the following registers must be written to in the order listed below. Also, see section [PLL Operation Across Sampling Frequency](#).

	ADDRESS (hex)	DATA (hex)
For 10 ≤ F _s ≤ 25 ⁽¹⁾	E3	0060
For 15 ≤ F _s ≤ 45 ⁽¹⁾	E3	00A0

(1) where F_s = sampling clock frequency

DIGITAL CHARACTERISTICS

DC specifications refer to the condition where the digital outputs are not switching, but are permanently at a valid logic level '0' or '1'. At $C_{LOAD} = 5\text{pF}^{(1)}$, $I_{OUT} = 3.5\text{mA}^{(2)}$, $R_{LOAD} = 100\Omega^{(2)}$, and no internal termination, unless otherwise noted.

PARAMETER	TEST CONDITIONS	ADS528x			UNIT
		MIN	TYP	MAX	
DIGITAL INPUTS					
High-level input voltage		1.4			V
Low-level input voltage				0.3	V
High-level input current			33		μA
Low-level input current			−33		μA
Input capacitance			3		pF
LVDS OUTPUTS					
High-level output voltage			1375		mV
Low-level output voltage			1025		mV
Output differential voltage, V _{OD}			350		mV
V _{OS} output offset voltage	Common-mode voltage of OUT _P and OUT _N		1200		mV
Output capacitance	Output capacitance inside the device, from either output to ground		2		pF

(1) C_{LOAD} is the effective external single-ended load capacitance between each output pin and ground.

(2) I_{OUT} refers to the LVDS buffer current setting; R_{LOAD} is the differential load resistance between the LVDS output pair.

ELECTRICAL CHARACTERISTICS⁽¹⁾

Typical values at +25°C. Minimum and maximum values are measured across the specified temperature range of $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = +85^{\circ}\text{C}$, $AVDD = 3.3\text{V}$, $LVDD = 1.8\text{V}$, clock frequency = 10MSPS to 65MSPS, 50% clock duty cycle, –1dBFS differential analog input, internal reference mode, I_{SET} resistor = 56.2k Ω , and LVDS buffer current setting = 3.5mA, unless otherwise noted.

PARAMETER		TEST CONDITIONS	ADS528x			UNIT
			MIN	TYP	MAX	
INTERNAL REFERENCE VOLTAGES						
V _{REFB}	Reference bottom			0.5	V	
V _{REFT}	Reference top			2.5	V	
	V _{REFT} – V _{REFB}	1.95	2.0	2.05	V	
V _{CM}	Common-mode voltage (internal)	1.425	1.5	1.575	V	
	V _{CM} output current		±2		mA	
EXTERNAL REFERENCE VOLTAGES						
V _{REFB}	Reference bottom	0.4	0.5	0.6	V	
V _{REFT}	Reference top	2.4	2.5	2.6	V	
	V _{REFT} – V _{REFB}	1.9	2.0	2.1	V	
ANALOG INPUT						
	Differential input voltage range		2.0		V _{PP}	
	Differential input capacitance		3		pF	
	Analog input bandwidth		520		MHz	
	Analog input common-mode range	DC-coupled input		V _{CM} ± 0.05	V	
	Analog input common-mode current	Per input pin per MSPS of sampling speed	2.5		µA/MHz per pin	
	Voltage overload recovery time	Recovery from 6dB overload to within 1% accuracy	1		Clock cycle	
	Voltage overload recovery repeatability	Standard deviation seen on a periodic first data within full-scale range in a 6dB overloaded sine wave	1		LSB	
DC ACCURACY						
	Offset error		–1.25	±0.2	+1.25	%FS
	Offset error temperature coefficient ⁽²⁾			±5		ppm/°C
	Channel gain error	Excludes error in internal reference		–0.8		%FS
	Channel gain error temperature coefficient	Excludes temperature coefficient of internal reference		±10		ppm/°C
	Internal reference error temperature coefficient ⁽³⁾			±15		ppm/°C
DC PSRR	DC power-supply rejection ratio ⁽⁴⁾			1.5		mV/V
POWER-DOWN MODES						
	Power in complete power-down mode			45		mW
	Power in partial power-down mode	Clock at 65MSPS		135		mW
	Power with no clock			88		mW
DYNAMIC PERFORMANCE						
	Crosstalk	5MHz full-scale signal applied to seven channels, measurement taken on channel with no input signal		–90		dBc
	Two-tone, third-order intermodulation distortion	f ₁ = 9.5MHz at –7dBFS f ₂ = 10.2MHz at –7dBFS		–92		dBFS

(1) All characteristics are common for the ADS528x family.

(2) The offset temperature coefficient in ppm/ $^{\circ}\text{C}$ is defined as $(O_1 - O_2) \times 10^6 / (T_1 - T_2) / 4096$, where O_1 and O_2 are the offset codes in LSB at the two extreme temperatures, T_1 and T_2 .

(3) The internal reference temperature coefficient is defined as $(REF_1 - REF_2) \times 10^6 / (T_1 - T_2) / 2$, where REF_1 and REF_2 are the internal reference voltages ($V_{REFT} - V_{REFB}$) at the two extreme temperatures, T_1 and T_2 .

(4) DC PSRR is defined as the ratio of the change in the ADC output (expressed in mV) to the change in supply voltage (in volts).

ELECTRICAL CHARACTERISTICS (BY DEVICE)⁽¹⁾

Typical values at +25°C. Minimum and maximum values are measured across the specified temperature range of $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = +85^{\circ}\text{C}$, $AVDD = 3.3\text{V}$, $LVDD = 1.8\text{V}$, clock frequency = 10MSPS to 65MSPS, 50% clock duty cycle, –1dBFS differential analog input, internal reference mode, I_{SET} resistor = 56.2k Ω , and LVDS buffer current setting = 3.5mA, unless otherwise noted.

FUNCTIONAL BLOCK DIAGRAM

LVDS TIMING DIAGRAM

DEFINITION OF SETUP AND HOLD TIMES

$$t_{SU} = \min(t_{SU1}, t_{SU2})$$

$$t_H = \min(t_{H1}, t_{H2})$$

TIMING CHARACTERISTICS^{(1) (2)}

PARAMETER	TEST CONDITIONS	ADS528x			UNIT
		MIN	TYP	MAX	
t_A Aperture delay		1.5		4.5	ns
Aperture delay variation	Channel-to-channel within the same device (3σ)		± 20		ps
t_J Aperture jitter			400		fs
t_{WAKE} Wake-up time	Time to valid data after coming out of COMPLETE POWER-DOWN mode		50		μ s
	Time to valid data after coming out of PARTIAL POWER-DOWN mode (with clock continuing to run during power-down)		2		μ s
	Time to valid data after stopping and restarting the input clock		40		μ s
Data latency			12		Clock cycles

(1) Timing characteristics are common to the ADS528x family.

(2) Timing parameters are ensured by design and characterization; not production tested.

LVDS OUTPUT TIMING CHARACTERISTICS^{(1) (2)}

Typical values are at +25°C, minimum and maximum values are measured across the specified temperature range of $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = +85^{\circ}\text{C}$, sampling frequency = as specified, $C_{LOAD} = 5\text{pF}^{(3)}$, $I_{OUT} = 3.5\text{mA}$, $R_{LOAD} = 100\Omega^{(4)}$, and no internal termination, unless otherwise noted.

PARAMETER		TEST CONDITIONS ⁽⁵⁾	ADS528x									UNIT
			40MSPS			50MSPS			65MSPS			
			MIN	TYP	MAX	MIN	TYP	MAX	MIN	TYP	MAX	
t _{SU}	Data setup time ⁽⁶⁾	Data valid ⁽⁷⁾ to zero-crossing of LCLK _P	0.67			0.47			0.27			ns
t _H	Data hold time ⁽⁶⁾	Zero-crossing of LCLK _P to data becoming invalid ⁽⁷⁾	0.85			0.65			0.4			ns
t _{PROP}	Clock propagation delay	Input clock (ADCLK) rising edge cross-over to output clock (ADCLK _P) rising edge cross-over	10	14	16.6	10	12.5	14.1	9.7	11.5	14	ns

- (1) All characteristics are at the maximum rated speed for each speed grade.
- (2) Timing parameters are ensured by design and characterization; not production tested.
- (3) C_{LOAD} is the effective external single-ended load capacitance between each output pin and ground.
- (4) I_{OUT} refers to the LVDS buffer current setting; R_{LOAD} is the differential load resistance between the LVDS output pair.
- (5) Measurements are done with a transmission line of 100Ω characteristic impedance between the device and the load.
- (6) Setup and hold time specifications take into account the effect of jitter on the output data and clock. These specifications also assume that data and clock paths are perfectly matched within the receiver. Any mismatch in these paths within the receiver would appear as reduced timing margin.
- (7) Data valid refers to a logic high of $+100\text{mV}$ and a logic low of -100mV .

LVDS OUTPUT TIMING CHARACTERISTICS^{(1) (2)}

Typical values are at +25°C, minimum and maximum values are measured across the specified temperature range of $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = +85^{\circ}\text{C}$, sampling frequency = as specified, $C_{LOAD} = 5\text{pF}^{(3)}$, $I_{OUT} = 3.5\text{mA}$, $R_{LOAD} = 100\Omega^{(4)}$, and no internal termination, unless otherwise noted.

- (1) All characteristics are at the speeds other than the maximum rated speed for each speed grade.
- (2) Timing parameters are ensured by design and characterization; not production tested.
- (3) C_{LOAD} is the effective external single-ended load capacitance between each output pin and ground.
- (4) I_{OUT} refers to the LVDS buffer current setting; R_{LOAD} is the differential load resistance between the LVDS output pair.
- (5) Measurements are done with a transmission line of 100Ω characteristic impedance between the device and the load.
- (6) Setup and hold time specifications take into account the effect of jitter on the output data and clock. These specifications also assume that data and clock paths are perfectly matched within the receiver. Any mismatch in these paths within the receiver would appear as reduced timing margin.
- (7) Data valid refers to a logic high of $+100\text{mV}$ and a logic low of -100mV .

LVDS OUTPUT TIMING CHARACTERISTICS

PARAMETER ⁽¹⁾	TEST CONDITIONS	TIMINGS WHEN USING REGISTER 0xE3 ⁽²⁾ At 40 MSPS		
		MIN	TYP	MAX
Data setup time	Data valid ⁽³⁾ to zero-crossing of LCLKp	0.60		
Data hold time	Zero-crossing of LCLKp to data becoming invalid ⁽³⁾	0.92		
Clock propagation delay	Input clock (ADCLK) rising edge cross-over to output clock (ADCLK) rising edge crossover	8	12	14.6

- (1) Only the setup time, hold time and clock propagation delay parameters are affected. Rest of the parameters are same as given in previous two tables.
- (2) Only timing specifications for 40MSPS are affected when using register 0xE3 (as specified in the recommended operating table section). The timing specifications for other clock frequencies are same as given in previous two tables.
- (3) Data valid refers to logic high of +100mV and logic low of –100mV.

RECOMMENDED POWER-UP SEQUENCING AND RESET TIMING

$10\mu\text{s} < t_1 < 50\text{ms}$, $10\mu\text{s} < t_2 < 50\text{ms}$, $-10\text{ms} < t_3 < 10\text{ms}$, $t_4 > 10\text{ms}$, $t_5 > 100\text{ns}$, $t_6 > 100\text{ns}$, $t_7 > 10\text{ms}$, and $t_8 > 100\mu\text{s}$.

- (1) The AVDD and LVDD power on sequence does not matter as long as $-10\text{ms} < t_3 < 10\text{ms}$. Similar considerations apply while shutting down the device.
- (2) Write initialization registers listed in the [Initialization Registers](#) table.

POWER-DOWN TIMING

Power-up time shown is based on $1\mu\text{F}$ bypass capacitors on the reference pins. t_{WAKE} is the time it takes for the device to wake up completely from power-down mode. The ADS528x has two power-down modes: complete power-down mode and partial power-down mode. The device can be configured in partial power-down mode through a register setting.

$t_{\text{WAKE}} < 50\mu\text{s}$ for complete power-down mode.

$t_{\text{WAKE}} < 2\mu\text{s}$ for partial power-down mode (provided the clock is not shut off during power-down).

SERIAL INTERFACE

The ADS528x has a set of internal registers that can be accessed through the serial interface formed by pins $\overline{\text{CS}}$ (chip select, active low), SCLK (serial interface clock), and SDATA (serial interface data). When $\overline{\text{CS}}$ is low, the following actions occur:

- Serial shift of bits into the device is enabled
- SDATA (serial data) is latched at every rising edge of SCLK
- SDATA is loaded into the register at every 24th SCLK rising edge

If the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active $\overline{\text{CS}}$ pulse. The first eight bits form the register address and the remaining 16 bits form the register data. The interface can work with SCLK frequencies from 20MHz down to very low speeds (a few hertz) and also with a non-50% SCLK duty cycle.

Register Initialization

After power-up, the internal registers **must** be initialized to the respective default values. Initialization can be done in one of two ways:

1. Through a hardware reset, by applying a low-going pulse on the $\overline{\text{RESET}}$ pin; or
2. Through a software reset; using the serial interface, set the RST bit high. Setting this bit initializes the internal registers to the respective default values and then self-resets the RST bit low. In this case, the $\overline{\text{RESET}}$ pin stays high (inactive).

After all registers have been initialized to their default values through a RESET operation, the registers detailed in the [Initialization Registers](#) table must be written into. This process must be done after every hardware or software RESET operation in order to reconfigure the device for the best mode of operation.

SERIAL INTERFACE TIMING

PARAMETER	DESCRIPTION	ADS528x			UNIT
		MIN	TYP	MAX	
t ₁	SCLK period	50			ns
t ₂	SCLK high time	20			ns
t ₃	SCLK low time	20			ns
t ₄	Data setup time	5			ns
t ₅	Data hold time	5			ns
t ₆	$\overline{\text{CS}}$ fall to SCLK rise	8			ns
t ₇	Time between last SCLK rising edge to $\overline{\text{CS}}$ rising edge	8			ns

	1						1					X					EN_SDR	Enables SDR output mode (LCLK becomes a 12x input clock).	DDR output mode
	1		X				1					1					FALL_SDR	Controls whether the LCLK rising or falling edge comes in the middle of the data window when operating in SDR output mode.	Rising edge of LCLK in middle of data window

SUMMARY OF FEATURES

FEATURES	DEFAULT	SELECTION	POWER IMPACT (relative to default) AT f _S = 65MSPS
ANALOG FEATURES			
Internal or external reference (driven on the REF _T and REF _B pins)	N/A	Pin	Internal reference mode uses approximately 23mW more power on AVDD
External reference driven on the V _{CM} pin	Off	Register 42	Approximately 9mW less power on AVDD
Duty cycle correction circuit	Off	Register 42	Approximately 7mW more power on AVDD
Low-frequency noise suppression	Off	Register 14	With zero input to the ADC, low-frequency noise suppression causes digital switching at f _S /2, thereby increasing LVDD power by approximately 7mW/channel
Single-ended or differential clock	Single-ended	Register 42	Differential clock mode uses approximately 7mW more power on AVDD
Power-down mode	Off	Pin and register 0F	Refer to the <i>Power-Down Modes</i> section in the Electrical Characteristics table
DIGITAL FEATURES			
Programmable digital gain (0dB to 12dB)	0dB	Registers 2A and 2B	No difference
Straight offset or BTC output	Straight offset	Register 46	No difference
Swap polarity of analog input pins	Off	Register 24	No difference
LVDS OUTPUT PHYSICAL LAYER			
LVDS internal termination	Off	Register 12	Approximately 7mW more power on AVDD
LVDS current programmability	3.5mA	Register 11	As per LVDS clock and data buffer current setting
LVDS OUTPUT TIMING			
LSB- or MSB-first output	LSB-first	Register 46	No difference
DDR or SDR output	DDR	Register 46	SDR mode uses approximately 2mW more power on LVDD (at f _S = 30MSPS)
LCLK phase relative to data output	Refer to Figure 1	Register 42	No difference

DESCRIPTION OF SERIAL REGISTERS

SOFTWARE RESET

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
00																X	RST

Software reset is applied when the RST bit is set to '1'; setting this bit resets all internal registers and self-clears to '0'.

POWER-DOWN MODES

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
0F									X	X	X	X	X	X	X	X	PDN_CH<8:1>
								X									PDN_PARTIAL
						0	X										PDN_COMPLETE
						X	0										PDN_PIN_CFG

Each of the eight channels can be individually powered down. PDN_CH<N> controls the power-down mode for the ADC channel <N>.

In addition to channel-specific power-down, the ADS528x also has two global power-down modes—partial power-down mode and complete power-down mode. Partial power-down mode partially powers down the chip; recovery from this mode is much quicker, provided that the clock has been running for at least 50μs before exiting this mode. Complete power-down mode, on the other hand, completely powers down the chip, and involves a much longer recovery time.

In addition to programming the device for either of these two power-down modes (through either the PDN_PARTIAL or PDN_COMPLETE bits, respectively), the PD pin itself can be configured as either a partial power-down pin or a complete power-down pin control. For example, if PDN_PIN_CFG = 0 (default), when the PD pin is high, the device enters complete power-down mode. However, if PDN_PIN_CFG = 1, when the PD pin is high, the device enters partial power-down mode.

LVDS DRIVE PROGRAMMABILITY

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
11														X	X	X	ILVDS_LCLK<2:0>
										X	X	X					ILVDS_FRAME<2:0>
						X	X	X									ILVDS_DAT<2:0>

The LVDS drive strength of the bit clock (LCLK_P or LCLK_N) and the frame clock (ADCLK_P or ADCLK_N) can be individually programmed. The LVDS drive strengths of all the data outputs OUT_P and OUT_N can also be programmed to the same value.

All three drive strengths (bit clock, frame clock, and data) are programmed using sets of three bits. [Table 5](#) shows an example of how the drive strength of the bit clock is programmed (the method is similar for the frame clock and data drive strengths).

Table 5. Bit Clock Drive Strength⁽¹⁾

ILVDS_LCLK<2>	ILVDS_LCLK<1>	ILVDS_LCLK<0>	LVDS DRIVE STRENGTH FOR LCLK _P AND LCLK _N
0	0	0	3.5mA (default)
0	0	1	2.5mA
0	1	0	1.5mA
0	1	1	0.5mA
1	0	0	7.5mA
1	0	1	6.5mA
1	1	0	5.5mA
1	1	1	4.5mA

(1) Current settings lower than 1.5mA are not recommended.

LVDS INTERNAL TERMINATION PROGRAMMABILITY

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
12		X															EN_LVDS_TERM
		1												X	X	X	TERM_LCLK<2:0>
		1								X	X	X					TERM_FRAME<2:0>
		1				X	X	X									TERM_DAT<2:0>

The LVDS buffers have high-impedance current sources driving the outputs. When driving traces whose characteristic impedance is not perfectly matched with the termination impedance on the receiver side, there may be reflections back to the LVDS output pins of the ADS528x that cause degraded signal integrity. By enabling an internal termination (between the positive and negative outputs) for the LVDS buffers, the signal integrity can be significantly improved in such scenarios. To set the internal termination mode, the EN_LVDS_TERM bit should be set to '1'. Once this bit is set, the internal termination values for the bit clock, frame clock, and data buffers can be independently programmed using sets of three bits. [Table 6](#) shows an example of how the internal termination of the LVDS buffer driving the bit clock is programmed (the method is similar for the frame clock and data buffers). These termination values are only typical values and can vary by up to $\pm 20\%$ across temperature and from device to device.

Table 6. Bit Clock Internal Termination

TERM_LCLK<2>	TERM_LCLK<1>	TERM_LCLK<0>	INTERNAL TERMINATION BETWEEN LCLK _P AND LCLK _N IN Ω
0	0	0	None
0	0	1	260
0	1	0	150
0	1	1	94
1	0	0	125
1	0	1	80
1	1	0	66
1	1	1	55

LOW-FREQUENCY NOISE SUPPRESSION MODE

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
14									X	X	X	X	X	X	X	X	LFNS_CH<8:1>

The low-frequency noise suppression mode is specifically useful in applications where good noise performance is desired in the frequency band of 0MHz to 1MHz (around dc). Setting this mode shifts the low-frequency noise of the ADS528x to approximately $f_s/2$, thereby moving the noise floor around dc to a much lower value. LFNS_CH<8:1> enables this mode individually for each channel.

ANALOG INPUT INVERT

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
24									X	X	X	X	X	X	X	X	INVERT_CH<8:1>

Normally, the IN_P pin represents the positive analog input pin, and IN_N represents the complementary negative input. Setting the bits marked INVERT_CH<8:1> (individual control for each channel) causes the inputs to be swapped. IN_N now represents the positive input, and IN_P the negative input.

LVDS TEST PATTERNS

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
25										X	0	0					EN_RAMP
										0	X	0					DUALCUSTOM_PAT
										0	0	X					SINGLE_CUSTOM_PAT
															X	X	BITS_CUSTOM1<11:0>
													X	X			BITS_CUSTOM2<11:0>
26	X	X	X	X	X	X	X	X	X	X							BITS_CUSTOM1<9:0>
27	X	X	X	X	X	X	X	X	X	X							BITS_CUSTOM2<9:0>
45															0	X	PAT_DESKEW
															X	0	PAT_SYNC

The ADS528x can output a variety of test patterns on the LVDS outputs. These test patterns replace the normal ADC data output. Setting EN_RAMP to '1' causes all the channels to output a repeating full-scale ramp pattern. The ramp increments from zero code to full-scale code in steps of 1LSB every clock cycle. After hitting the full-scale code, it returns back to zero code and ramps again.

The device can also be programmed to output a constant code by setting SINGLE_CUSTOM_PAT to '1', and programming the desired code in BITS_CUSTOM1<11:0>. In this mode, BITS_CUSTOM1<11:0> take the place of the 12-bit ADC data at the output, and are controlled by LSB-first and MSB-first modes in the same way as normal ADC data are.

The device may also be made to toggle between two consecutive codes by programming DUAL_CUSTOM_PAT to '1'. The two codes are represented by the contents of BITS_CUSTOM1<11:0> and BITS_CUSTOM2<11:0>.

In addition to custom patterns, the device may also be made to output two preset patterns:

1. **Deskew patten:** Set using PAT_DESKEW, this mode replaces the 12-bit ADC output D<11:0> with the 010101010101 word.
2. **Sync pattern:** Set using PAT_SYNC, the normal ADC word is replaced by a fixed 111111000000 word.

Note that only one of the above patterns should be active at any given instant.

PROGRAMMABLE GAIN

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
2A									X	X	X	X	X	X	X	X	GAIN_CH1<3:0>
									X	X	X	X					GAIN_CH2<3:0>
					X	X	X	X									GAIN_CH3<3:0>
	X	X	X	X													GAIN_CH4<3:0>
2B	X	X	X	X													GAIN_CH5<3:0>
					X	X	X	X									GAIN_CH6<3:0>
									X	X	X	X					GAIN_CH7<3:0>
													X	X	X	X	GAIN_CH8<3:0>

In applications where the full-scale swing of the analog input signal is much less than the $2V_{PP}$ range supported by the ADS528x, a programmable gain can be set to achieve the full-scale output code even with a lower analog input swing. The programmable gain not only fills the output code range of the ADC, but also enhances the SNR of the device by utilizing quantization information from some extra internal bits. The programmable gain for each channel can be individually set using a set of four bits, indicated as GAIN_CHN<3:0> for Channel N. The gain setting is coded in binary from 0dB to 12dB, as shown in [Table 7](#).

Table 7. Gain Setting for Channel 1

GAIN_CH1<3>	GAIN_CH1<2>	GAIN_CH1<1>	GAIN_CH1<0>	CHANNEL 1 GAIN SETTING
0	0	0	0	0dB
0	0	0	1	1dB
0	0	1	0	2dB
0	0	1	1	3dB
0	1	0	0	4dB
0	1	0	1	5dB
0	1	1	0	6dB
0	1	1	1	7dB
1	0	0	0	8dB
1	0	0	1	9dB
1	0	1	0	10dB
1	0	1	1	11dB
1	1	0	0	12dB
1	1	0	1	Do not use
1	1	1	0	Do not use
1	1	1	1	Do not use

INPUT CLOCK

The ADS528x is configured by default to operate with a single-ended input clock—CLK_P is driven by a CMOS clock and CLK_N is tied to '0'. However, by programming DIFF_CLK to '1', the device can be made to work with a differential input clock on CLK_P and CLK_N. Operating with a low-jitter differential clock usually gives better SNR performance, especially at input frequencies greater than 30MHz.

In cases where the duty cycle of the input clock falls outside the 45% to 55% range, it is recommended to enable an internal duty cycle correction circuit. This enabling is done by setting the EN_DCC bit to '1'.

EXTERNAL REFERENCE

The ADS528x can be made to operate in external reference mode by pulling the INT/ $\overline{\text{EXT}}$ pin to '0'. In this mode, the REF_T and REF_B pins should be driven with voltage levels of 2.5V and 0.5V, respectively, and must have enough drive strength to drive the switched capacitance loading of the reference voltages by each ADC. The advantage of using the external reference mode is that multiple ADS528x units can be made to operate with the same external reference, thereby improving parameters such as gain matching across devices. However, in applications that do not have an available high drive, differential external reference, the ADS528x can still be driven with a single external reference voltage on the V_{CM} pin. When EXT_REF_VCM is set as '1' (and the INT/ $\overline{\text{EXT}}$ pin is set to '0'), the V_{CM} pin is configured as an input pin, and the voltages on REF_T and REF_B are generated as shown in [Equation 1](#) and [Equation 2](#).

$$\text{VREF}_T = 1.5\text{V} + \frac{\text{V}_{\text{CM}}}{1.5\text{V}} \quad (1)$$

$$\text{VREF}_B = 1.5\text{V} - \frac{\text{V}_{\text{CM}}}{1.5\text{V}} \quad (2)$$

BIT CLOCK PROGRAMMABILITY

The output interface of the ADS528x is normally a DDR interface, with the LCLK rising edge and falling edge transitions in the middle of alternate data windows. This default phase is shown in [Figure 1](#).

Figure 1. Default Phase of LCLK

The phase of LCLK can be programmed relative to the output frame clock and data using bits PHASE_DDR<1:0>. The LCLK phase modes are shown in [Figure 2](#).

Figure 2. Phase Programmability Modes for LCLK

In addition to programming the phase of LCLK in the DDR mode, the device can also be made to operate in SDR mode by setting the EN_SDR bit to '1'. In this mode, the bit clock (LCLK) is output at 12x times the input clock, or twice the rate as in DDR mode. Depending on the state of FALL_SDR, LCLK may be output in either of the two manners shown in Figure 3. As can be seen in Figure 3, only the LCLK rising (or falling) edge is used to capture the output data in SDR mode.

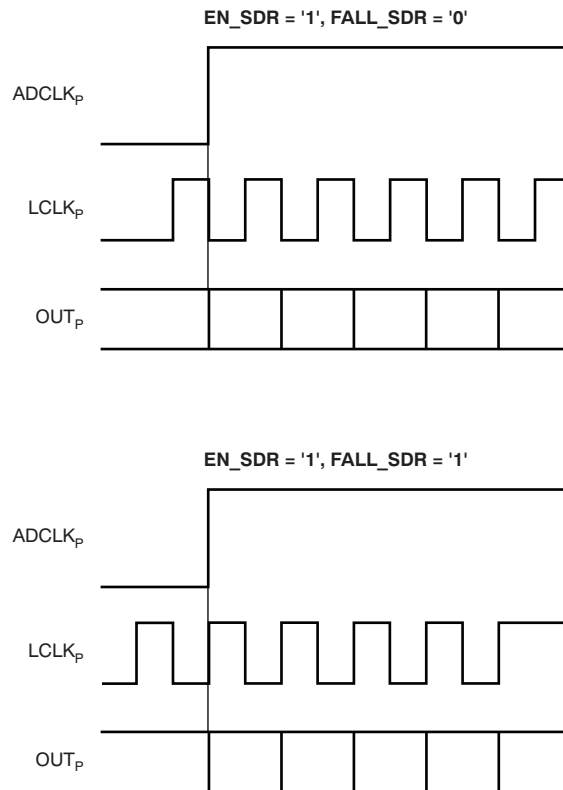

Figure 3. SDR Interface Modes

The SDR mode does not work well beyond 40MSPS because the LCLK frequency becomes very high.

DATA OUTPUT FORMAT MODES

The ADC output, by default, is in straight offset binary mode. Programming the BTC_MODE bit to '1' inverts the MSB, and the output becomes binary two's complement mode.

Also by default, the first bit of the frame (following the rising edge of ADCLK_p) is the LSB of the ADC output. Programming the MSB_FIRST mode inverts the bit order in the word, and the MSB is output as the first bit following the ADCLK_p rising edge.

TYPICAL CHARACTERISTICS

APPLICATION INFORMATION

THEORY OF OPERATION

The ADS528x devices are a family of 8-channel, high-speed, CMOS ADCs. The 12 bits given out by each channel are serialized and sent out on a single pair of pins in LVDS format. All eight channels of the ADS528x operate from a single clock (ADCLK). The sampling clocks for each of the eight channels are generated from the input clock using a carefully matched clock buffer tree. The 12x clock required for the serializer is generated internally from ADCLK using a phase-locked loop (PLL). A 6x and a 1x clock are also output in LVDS format, along with the data, to enable easy data capture. The ADS528x operates from internally-generated reference voltages that are trimmed to improve to a high level of accuracy. Trimmed references improve the gain matching across devices, and provide the option to operate the devices without having to externally drive and route reference lines. The nominal values of REF_T and REF_B are 2.5V and 0.5V, respectively. The references are internally scaled down differentially by a factor of 2. This scaling results in a differential input of $-1V$ to correspond to the zero code of the ADC, and a differential input of $+1V$ to correspond to the full-scale code (4095 LSB). V_{CM} (the common-mode voltage of REF_T and REF_B) is also made available externally through a pin, and is nominally 1.5V.

The ADC employs a pipelined converter architecture that consists of a combination of multi-bit and single-bit internal stages. Each stage feeds its data into the digital error correction logic, ensuring excellent differential linearity and no missing codes at the 12-bit level.

The ADC output goes to a serializer that operates from a 12x clock generated by the PLL. The 12 data bits from each channel are serialized and sent LSB first. In addition to serializing the data, the serializer also generates a 1x clock and a 6x clock. These clocks are generated in the same way the serialized data are generated, so these clocks maintain perfect synchronization with the data. The data and clock outputs of the serializer are buffered externally using LVDS buffers. Using LVDS buffers to transmit data externally has multiple advantages, such as a reduced number of output pins (saving routing space on the board), reduced power consumption, and reduced effects of digital noise coupling to the analog circuit inside the ADS528x.

The ADS528x operates from two sets of supplies and grounds. The analog supply and ground set is identified as AVDD and AVSS, while the digital set is identified by LVDD and LVSS.

ANALOG INPUT

The analog input consists of a switched-capacitor based, differential sample-and-hold architecture. This differential topology results in very good ac performance even for high input frequencies at high sampling rates. The IN_N and IN_P pins must be externally biased around a common-mode voltage of 1.5V, available on V_{CM} . For a full-scale differential input, each input pin (IN_N and IN_P) must swing symmetrically between $V_{CM} + 0.5V$ and $V_{CM} - 0.5V$, resulting in a $2V_{PP}$ differential input swing. The maximum input peak-to-peak differential swing is determined to be the difference between the internal reference voltages REF_T (2.5V nominal) and REF_B (0.5V nominal). [Figure 34](#) illustrates the model of the input driving circuit.

Figure 34. Analog Input Circuit Model

Input Common-Mode Current

The input stage of all eight ADCs together sinks a common-mode current on the order of 2mA at 50MSPS. Equation 3 describes the dependency of the common-mode current and the sampling frequency.

$$\frac{(2\text{mA}) \times f_s}{50\text{MSPS}} \quad (3)$$

If the driving stage is dc-coupled to the inputs, then Equation 3 can be used to determine its common-mode drive capability and impedance. The inputs can also be ac-coupled to the IN_N and IN_P pins. In that case, the input common-mode is set by two internal 1.2kΩ resistors connecting the input pins to V_{CM} . This architecture is shown in Figure 35.

When the inputs are ac-coupled, there is a drop in the voltages at IN_P and IN_N relative to V_{CM} . This can be computed from Equation 3. At 50MSPS, for example, the drop at each of the 16 input pins is 150mV, which is not optimal for ADC operation. Initialization Registers 1 and 5, described in the Initialization Registers table, can be used to partially reduce the effect of this input common-mode drop

during ac-coupling by increasing V_{CM} by roughly 75mV. When operating above 50MSPS, it is recommended that additional parallel resistors be added externally to restore the input common-mode to at least 1.4V, if the inputs are to be ac-coupled.

Dashed area denotes one of eight channels.

Figure 35. Common-Mode Biasing of Input Pins

Driving Circuit

For optimum performance, the analog inputs must be driven differentially. This approach improves the common-mode noise immunity and even-order harmonic rejection. Input configurations using RF transformers suitable for low and high input frequencies are shown in Figure 36 and Figure 37, respectively. The single-ended signal is fed to the primary winding of the RF transformer. The transformer is terminated by 50Ω resistor on the secondary side. Placing the termination on the secondary side helps to shield the kicks caused by the input sampling capacitors from the RF transformer leakage inductances. The termination is accomplished by two 25Ω resistors, connected in series, with the center point connected to the 1.5V common-mode. The 4.7Ω resistor in series with each input pin is required to damp the ringing caused by the device package parasitics.

At high input frequencies, the mismatch in the transformer parasitic capacitance (between the windings) results in degraded even-order harmonic performance. Connecting two identical RF transformers back-to-back helps to minimize this mismatch, and good performance is obtained for high-frequency input signals. An additional termination resistor pair is required between the two transformers, as shown in Figure 37. The center point of this termination is connected to ground to improve the balance between the positive and negative sides. The values of the terminations between the transformers and on the secondary side must be chosen to achieve an overall 50Ω (in the case of 50Ω source impedance).

Figure 36. Drive Circuit at Low Input Frequencies

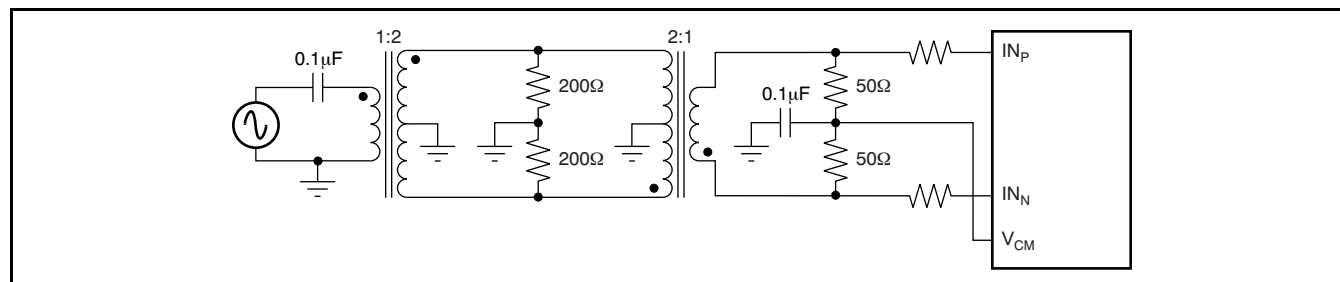

Figure 37. Drive Circuit at High Input Frequencies

CLOCK INPUT

The eight channels on the device operate from a single ADCLK input. To ensure that the aperture delay and jitter are the same for all channels, a clock tree network is used to generate individual sampling clocks to each channel. The clock paths for all the channels are matched from the source point to the sampling circuit. This architecture ensures that the performance and timing for all channels are identical. The use of the clock tree for matching introduces an aperture delay that is defined as the delay between the rising edge of ADCLK and the actual instant of sampling. The aperture delays for all the channels are matched to the best possible extent. A mismatch of $\pm 20\text{ps}$ ($\pm 3\sigma$) could exist between the aperture instants of the eight ADCs within the same chip. However, the aperture delays of ADCs across two different chips can be several hundred picoseconds apart.

The ADS528x can be made to operate either in CMOS single-ended clock mode (default is DIFF_CLK = 0) or differential clock mode (SINE, LVPECL, or LVDS). When operating in the single-ended clock mode, CLK_N must be forced to 0V_{DC}, and the single-ended CMOS applied on the CLK_P pin. This operation is shown in Figure 38.

Figure 38. Single-Ended Clock Driving Circuit (DIFF_CLK = 0)

When configured to operate in the differential clock mode (register bit DIFF_CLK = 1) the ADS528x clock inputs can be driven differentially (SINE, LVPECL, or LVDS) with little or no difference in performance between them, or with a single-ended (LVCMOS). The common-mode voltage of the clock inputs is set to V_{CM} using internal 5kΩ resistors, as shown in Figure 39. This method allows using transformer-coupled drive circuits for a sine wave clock or ac-coupling for LVPECL and LVDS clock sources, as shown in Figure 40. When operating in the differential clock mode, the single-ended CMOS clock can be ac-coupled to the CLK_P input, with CLK_N (pin 11) connected to ground with a 0.1μF capacitor, as shown in Figure 41.

Figure 39. Internal Clock Buffer

Figure 40. Differential Clock Driving Circuit (DIFF_CLK = 1)

Figure 41. Single-Ended Clock Driving Circuit When DIFF_CLK = 1

For best performance, the clock inputs must be driven differentially in order to reduce susceptibility to common-mode noise. For high input frequency sampling, it is recommended to use a clock source with very low jitter. Bandpass filtering of the clock source can help reduce the effect of jitter. If the duty cycle deviates from 50% by more than 2% or 3%, it is recommended to enable the DCC through register bit EN_DCC.

PLL OPERATION ACROSS SAMPLING FREQUENCY

The ADS528X uses a PLL for generating the high speed bit clock (LCLK), the frame clock (ADCLK) & internal clocks for the serializer operation.

To enable operation across the entire frequency range, the PLL is automatically configured to one of four states, depending on the sampling clock frequency range. The frequency range detection is automatic and each time the sampling frequency crosses a threshold, the PLL changes its configuration to a new state. To prevent unwanted toggling of PLL state around a threshold, the circuit has an inbuilt hysteresis. The ADS528x has three thresholds – taking into account the hysteresis range of each threshold, variation across devices and temperature, the thresholds can span the sampling clock frequency range from 10MHz to 45MHz.

Figure 42. Variation of Thresholds Across Sampling Frequency

Based on actual system clock frequency, there are two scenarios:

1. For sampling clock frequency < 45MSPS

After system power up, depending on the frequency of operation and the frequency threshold for the given device, the frequency range detection circuit may change state once. In some applications where a timing calibration might be done at the system level once after power up, this subsequent change of the PLL state might be undesirable as it can cause a loss of alignment in the received data. A software fix for eliminating this one-time change of PLL state exists using the serial register interface:

- Disable the automatic switch of the PLL configuration based on frequency detected.
- In addition to disabling the switching, it is also required to set the PLL to the correct configuration, depending on the sample clock frequency used in the system.

The following sequence of register writes must be followed:

Step 1: Write Address = 0x01, Data = 0x0010

Step 2: Disable the PLL automatic switch and set the PLL configuration depending on the clock frequency

SAMPLE CLOCK FREQUENCY RANGE (MSPS)		REGISTER SETTING (Hex)	
Min	Max	Address	Data
10	25	E3	0060
15	45	E3	00A0

With the above settings applied for the respective frequency ranges, the part will continue to operate as per the stated datasheet specifications for all timing parameters at all specified frequencies, EXCEPT for the timing specifications at 40MSPS. At 40MSPS, the affected parameters are – Data setup time, Data hold time and Clock propagation delay (refer to LVDS Timing).

2. For sampling clock frequency ≥ 45MSPS

As there are no PLL thresholds beyond 45MHz, no change in PLL configuration can occur as the temperature in the system stabilizes. The ADS528x can be used in the system without using the above software fix.

INPUT OVER-VOLTAGE RECOVERY

The differential peak-to-peak full-scale range supported by the ADS528x is nominally 2.0V. The ADS528x is specially designed to handle an over-voltage condition where the differential peak-to-peak voltage can be up to twice the ADC full-scale range. If the input common-mode is not considerably off from V_{CM} during overload (less than 300mV around the nominal value of 1.5V), recovery from an over-voltage pulse input of twice the amplitude of a full-scale pulse is expected to be within one clock cycle when the input switches from overload to zero signal.

REFERENCE CIRCUIT

The digital beam-forming algorithm in an ultrasound system relies on gain matching across all receiver channels. A typical system would have about 12 octal ADCs on the board. In such a case, it is critical to ensure that the gain is matched, essentially requiring the reference voltages seen by all the ADCs to be the same. Matching references within the eight channels of a chip is done by using a single internal reference voltage buffer. Trimming the reference voltages on each chip during production ensures that the reference voltages are well-matched across different chips.

All bias currents required for the internal operation of the device are set using an external resistor to ground at the I_{SET} pin. Using a 56.2kΩ resistor on I_{SET} generates an internal reference current of 20μA. This current is mirrored internally to generate the bias current for the internal blocks. Using a larger external

resistor at I_{SET} reduces the reference bias current and thereby scales down the device operating power. However, it is recommended that the external resistor be within 10% of the specified value of 56.2k Ω so that the internal bias margins for the various blocks are proper.

Buffering the internal bandgap voltage also generates the common-mode voltage V_{CM} , which is set to the midlevel of REF_T and REF_B , and is accessible on a pin (pin 65 in TQFP-80 package, pin 53 in QFN-64 package). It is meant as a reference voltage to derive the input common-mode if the input is directly coupled. It can also be used to derive the reference common-mode voltage in the external reference mode. The suggested decoupling for the reference pins is shown in [Figure 43](#).

Figure 43. Suggested Decoupling on the Reference Pins

The device also supports the use of external reference voltages. There are two methods to force the references externally. The first method involves pulling INT/EXT low and forcing externally REF_T and REF_B to 2.5V and 0.5V nominally, respectively. In this mode, the internal reference buffer goes to a 3-state output. The external reference driving circuit should be designed to provide the required switching current for the eight ADCs inside the chip. It should be noted that in this mode, V_{CM} and I_{SET} continue to be generated from the internal bandgap voltage, as in the internal reference mode. It is therefore important to ensure that the common-mode voltage of the externally-forced reference voltages matches to within 50mV of V_{CM} .

The second method of forcing the reference voltages externally can be accessed by pulling INT/EXT low, and programming the serial interface to drive the external reference mode through the V_{CM} pin (register bit called EXT_REF_VCM). In this mode, V_{CM} becomes configured as an input pin that can be driven from external circuitry. The internal reference buffers driving REF_T and REF_B are active in this mode. Forcing 1.5V on the V_{CM} pin in the mode results in REF_T and REF_B coming to 2.5V and 0.5V, respectively. In general, the voltages on REF_T and REF_B in this mode are given by [Equation 4](#) and [Equation 5](#), respectively:

$$V_{REF_T} = 1.5V + \frac{V_{CM}}{1.5V} \quad (4)$$

$$V_{REF_B} = 1.5V - \frac{V_{CM}}{1.5V} \quad (5)$$

The state of the reference voltage internal buffers during various combinations of the PD, INT/EXT, and EXT_REF_VCM register bits is described in [Table 8](#).

Table 8. State of Reference Voltages for Various Combinations of PD, INT/EXT, and EXT_REF_VCM

REGISTER BIT	INTERNAL BUFFER STATE							
PD	0	0	1	1	0	0	1	1

(1) Weakly forced with reduced strength.

NOISE COUPLING ISSUES

High-speed mixed signals are sensitive to various types of noise coupling. One primary source of noise is the switching noise from the serializer and the output buffers. Maximum care is taken to isolate these noise sources from the sensitive analog blocks. As a starting point, the analog and digital domains of the device are clearly demarcated. AVDD and AVSS are used to denote the supplies for the analog

sections, while LVDD and LVSS are used to denote the digital supplies. Care is taken to ensure that there is minimal interaction between the supply sets within the device. The extent of noise coupled and transmitted from the digital to the analog sections depends on:

1. The effective inductances of each of the supply and ground sets.
2. The isolation between the digital and analog supply and ground sets.

Smaller effective inductance of the supply and ground pins leads to better noise suppression. For this reason, multiple pins are used to drive each supply and ground. It is also critical to ensure that the impedances of the supply and ground lines on the board are kept to the minimum possible values. Use of ground planes in the printed circuit board (PCB) as well as large decoupling capacitors between the supply and ground lines are necessary to obtain the best possible SNR performance from the device.

It is recommended that the isolation be maintained on the board by using separate supplies to drive AVDD and LVDD, as well as separate ground planes for AVSS and LVSS. The use of LVDS buffers reduces the injected noise considerably, compared to CMOS buffers. The current in the LVDS buffer is independent of the direction of switching. Also, the low output swing as well as the differential nature of the LVDS buffer results in low-noise coupling.

REVISION HISTORY

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

VQFN - 1 mm max height

Figure 1 is a detailed layout of the 16-pin package. It shows a square package with 16 pins (8 on each side). Key dimensions include: pin pitch of 0.6mm (64X(0.6)), pin width of 0.24mm (64X(0.24)), pin height of 0.5mm (60X(0.5)), and overall dimensions of 2X(8.8) and 2X(7.5). A central 5x5 grid of vias is shown with a diameter of 0.2mm (45X(Ø0.2) (TYP) VIA). Symmetry lines are indicated with 'SYMM' and center marks. A note points to the solder mask detail.

The diagram illustrates two methods for defining a solder mask opening on a PCB:

- Preferred Method (Left):** Labeled "NON SOLDER MASK DEFINED (PREFERRED)". It shows a rectangular opening in the solder mask. The opening is defined by the metal pad. The dimension "0.07 MAX ALL AROUND" is indicated. Labels include "EXPOSED METAL", "METAL", and "SOLDER MASK OPENING".
- Non-Preferred Method (Right):** Labeled "SOLDER MASK DEFINED". It shows a rectangular opening in the solder mask. The opening is defined by the solder mask itself. The dimension "0.07 MIN ALL AROUND" is indicated. Labels include "SOLDER MASK OPENING", "EXPOSED METAL", "METAL UNDER SOLDER MASK", and "SOLDER MASK DEFINED".

4219009/A 10/2018

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sl原因271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - F. Falls within JEDEC MS-026

THERMAL PAD MECHANICAL DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

LAND PATTERN DATA

PFP (S-PQFP-G80)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.
