## Frequency Generator \& Integrated Buffers for PENTIUM/Pro ${ }^{\text {TM }}$

## General Description

The ICS9248-39 generates all clocks required for high speed RISC or CISC microprocessor systems such as Intel PentiumPro or Cyrix. Eight different reference frequency multiplying factors are externally selectable with smooth frequency transitions.

Features include two CPU, six PCI and thirteen SDRAM clocks. Two reference outputs are available equal to the crystal frequency. Plus the IOAPIC output powered by VDDL1. One 48 MHz for USB, and one 24 MHz clock for Super IO. Spread Spectrum built in at $\pm 0.5 \%$ or $\pm 0.25 \%$ modulation to reduce the EMI. Serial programming $I^{2} \mathrm{C}$ interface allows changing functions, stop clock programing and Frequency selection. Additionally, the device meets the Pentium power-up stabilization, which requires that CPU and PCI clocks be stable within 2 ms after power-up. It is not recommended to use I/O dual function pin for the slots (ISA, PIC, CPU, DIMM). The add on card might have a pull up or pull down.

High drive PCICLK and SDRAM outputs typically provide greater than $1 \mathrm{~V} /$ ns slew rate into 30 pF loads. CPUCLK outputs typically provide better than $1 \mathrm{~V} /$ ns slew rate into 20 pF loads while maintaining $50 \pm 5 \%$ duty cycle. The REF and 24 and 48 MHz clock outputs typically provide better than $0.5 \mathrm{~V} /$ ns slew rates into 20 pF .

## Block Diagram

0277G-08/04/04

## Features

- 3.3 V outputs: SDRAM, PCI, REF, 48/24MHz
- 2.5 V outputs: CPU, IOAPIC
- 20 ohm CPU clock output impedance
- 20 ohm PCI clock output impedance
- Skew from CPU (earlier) to PCI clock - 1.5 to 4 ns , center 2.6 ns.
- No external load cap for $\mathrm{C}_{\mathrm{L}}=18 \mathrm{pF}$ crystals
- $\pm 175$ ps CPU clock skew
- 250ps (cycle to cycle) CPU jitter
- Smooth frequency switch, with selections from 66.8 to 150 MHz CPU.
- $\mathrm{I}^{2} \mathrm{C}$ interface for programming
- 3ms power up clock stable time
- Clock duty cycle 45-55\%.
- 48 pin 300 mil SSOP package
- 3.3 V operation, 5 V tolerant inputs (with series R )
- $<5 n s$ propagation delay SDRAM from Buffer Input

Pin Configuration

## 48-Pin SSOP

* Internal Pull-up Resistor of 240K to VDD
** Internal Pull-down resistor of 240K to GND

## Power Groups

```
VDD1 = REF (0:1), X1, X2
VDD2 = PCICLK_F, PCICLK(0:4)
VDD3 = SDRAM (0:12), supply for PLL core
VDD4 = 24MHz,48MHz
VDDL1 = IOAPIC
VDDL2 = CPUCLK 1, CPUCLK_F
VDD1 = REF (0:1), X1, X2
VDD2 \(=\) PCICLK_F, PCICLK(0:4)
VDD3 \(=\) SDRAM (0:12), supply for PLL core
VDD4 = 24MHz, 48MHz
VDDL1 = IOAPIC
VDDL2 = CPUCLK 1, CPUCLK_F
```

## Renesns

## Pin Descriptions

| PIN NUMBER | PIN NAME | TYPE | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1 | VDD1 | PWR | Ref (0:2), XTAL power supply, nominal 3.3V |
| 2 | REF0 | OUT | 14.318 Mhz reference clock. This REF output is the STRONGER buffer for ISA BUS loads |
|  | PCI_STOP\# ${ }^{1}$ | IN | Halts PCICLK(0:4) clocks at logic 0 level, when input low (In mobile mode, $\mathrm{MODE}=0$ ) |
| $\begin{gathered} \hline 3,9,16,22, \\ 33,39,45 \end{gathered}$ | GND | PWR | Ground |
| 4 | X1 | IN | Crystal input, has internal load cap (36pF) and feedback resistor from X2 |
| 5 | X2 | OUT | Crystal output, nominally 14.318 MHz . Has internal load cap (36pF) |
| 6,14 | VDD2 | PWR | Supply for PCICLK_F and PCICLK (0:4), nominal 3.3V |
| 7 | PCICLK_F | OUT | Free running PCI clock not affected by PCI_STOP\# for power management. |
|  | MODE ${ }^{1,2}$ | IN | Pin 2 function select pin, $1=$ Desktop Mode, $0=$ Mobile Mode. Latched Input. |
| 8 | FS3 | IN | Frequency select pin. Latched Input. Internal Pull-down to GND |
|  | PCICLK0 | OUT | PCI clock outputs. Syncheronous to CPU clocks with 1-48ns skew (CPU early) |
| 10, 11, 12, 13 | PCICLK (1:4) | OUT | PCI clock outputs. Syncheronous to CPU clocks with 1-48ns skew (CPU early) |
| 15 | BUFFER IN | IN | Input to Fanout Buffers for SDRAM outputs. |
| $\begin{gathered} 17,18,20,21, \\ 28,29,31,32, \\ 34,35,37,38 \\ \hline \end{gathered}$ | SDRAM (11:0) | OUT | SDRAM clock outputs, Fanout Buffer outputs from BUFFER IN pin (controlled by chipset). |
| 19,30,36 | VDD3 | PWR | Supply for SDRAM (0:12) and CPU PLL Core, nominal 3.3V. |
| 23 | SDATA | IN | Data input for ${ }^{2} \mathrm{C}$ serial input, 5 V tolerant input |
| 24 | SCLK | IN | Clock input of ${ }^{2} \mathrm{C}$ input, 5 V tolerant input |
| 25 | 24 MHz | OUT | 24 MHz output clock |
|  | FS1 ${ }^{1,2}$ | IN | Frequency select pin. Latched Input. |
| 26 | 48 MHz | OUT | 48 MHz output clock |
|  | FS0 ${ }^{1,2}$ | IN | Frequency select pin. Latched Input |
| 27 | VDD4 | PWR | Power for 24 \& 48MHz output buffers and fixed PLL core. |
| 40 | SDRAM_F | OUT | Free running SDRAM clock output. Not affected by CPU_STOP\# |
| 41 | CPU_STOP\# | IN | This asynchronous input halts CPUCLK1, IOAPIC \& SDRAM ( $0: 11$ ) at logic " 0 " level when driven low. |
| 42 | VDDL2 | PWR | Supply for CPU clocks, either 2.5V or 3.3V nominal |
| 43 | CPUCLK1 | OUT | CPU clock outputs, powered by VDDL2. Low if CPU STOP\#=Low |
| 44 | CPUCLK_F | OUT | Free running CPU clock. Not affected by the CPU_STOP\# |
| 46 | REF1 | OUT | 14.318 MHz reference clock. |
|  | FS2 ${ }^{1,2}$ | IN | Frequency select pin. Latched Input |
| 47 | IOAPIC | OUT | IOAPIC clock output. 14.318 MHz Powered by VDDL1. |
| 48 | VDDL1 | PWR | Supply for IOAPIC, either 2.5 or 3.3V nominal |

## Renesns

## Absolute Maximum Ratings

| Supply Voltage | 5.5 V |
| :---: | :---: |
| Logic Inputs | GND -0.5 V to VDD +0.5 V |
| Ambient Operating Temperature | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ |
| Case Temperature | $115^{\circ} \mathrm{C}$ |
| Storage Temperature | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

## General $I^{2} C$ serial interface information

The information in this section assumes familiarity with $I^{2} C$ programming. For more information, contact ICS for an $I^{2} \mathrm{C}$ programming application note.

## How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D2 ${ }_{(\mathrm{H})}$
- ICS clock will acknowledge
- Controller (host) sends a dummy command code
- ICS clock will acknowledge
- Controller (host) sends a dummy byte count
- ICS clock will acknowledge
- Controller (host) starts sending first byte (Byte 0 ) through byte 5
- ICS clock will acknowledge each byte one at a time.
- Controller (host) sends a Stop bit

| How to Write: |  |
| :---: | :---: |
| Controller (Host) | ICS (Slave/Receiver) |
| Start Bit |  |
| Address <br> D2 (H) |  |
| Dummy Command Code | ACK |
| Dummy Byte Count | ACK |
| Byte 0 | ACK |
| Byte 1 | ACK |
| Byte 2 |  |
| Byte 3 | ACK |
| Byte 4 | ACK |
| Byte 5 | ACK |
|  | ACK |
| Stop Bit | ACK |

## How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the read address D3 ${ }_{(\mathrm{H})}$
- ICS clock will acknowledge
- ICS clock will send the byte count
- Controller (host) acknowledges
- ICS clock sends first byte (Byte 0) through byte 5
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

| How to Read: |  |
| :---: | :---: |
| Controller (Host) | ICS (Slave/Receiver) |
| Start Bit |  |
| Address $_{\text {D3 }_{(H)}}$ |  |
|  | ACK |
| ACK | Byte Count |
|  | Byte 0 |
| ACK | Byte 1 |
|  | Byte 2 |
| ACK | Byte 3 |
| ACK |  |
| ACK | Byte 4 |
|  | Byte 5 |
| ACK |  |
|  |  |
| ACK |  |
| Stop Bit |  |

## Notes:

1. The ICS clock generator is a slave/receiver, $I^{2} C$ component. It can read back the data stored in the latches for verification. Read-Back will support Intel PIIX4 "Block-Read" protocol.
2. The data transfer rate supported by this clock generator is 100 K bits $/ \mathrm{sec}$ or less (standard mode)
3. The input is operating at 3.3 V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator $l^{2} \mathrm{C}$ interface, the protocol is set to use only "Block-Writes" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

## Renesns

## CPU_STOP\# Timing Diagram

CPU_STOP\# is an asychronous input to the clock synthesizer. It is used to turn off the CPU clocks for low power operation. CPU_STOP\# is synchronized by the ICS9248-39. The minimum that the CPU clock is enabled (CPU_STOP\# high pulse) is 100 CPU clocks. All other clocks will continue to run while the CPU clocks are disabled. The CPU clocks will always be stopped in a low state and start in such a manner that guarantees the high pulse width is a full pulse. CPU clock on latency is less than 4 CPU clocks and CPU clock off latency is less than 4 CPU clocks.

## Notes:

1. All timing is referenced to the internal CPU clock.
2. CPU_STOP\# is an asynchronous input and metastable conditions may exist. This signal is synchronized to the CPU clocks inside the ICS9248-39.
3. IOAPIC output is Stopped Glitch Free by CPUSTOP\# going low.
4. SDRAM-F output is controlled by Buffer in signal, not affected by the ICS9248-39 CPU_STOP\# signal. SDRAM (0:11) are controlled as shown.
5. All other clocks continue to run undisturbed.

## Renesns

## PCI_STOP\# Timing Diagram

PCI_STOP\# is an asynchronous input to the ICS9248-39. It is used to turn off the PCICLK (0:4) clocks for low power operation. PCI_STOP\# is synchronized by the ICS9248-39 internally. The minimum that the PCICLK (0:4) clocks are enabled (PCI_STOP\# high pulse) is at least 10 PCICLK ( $0: 4$ ) clocks. PCICLK ( $0: 4$ ) clocks are stopped in a low state and started with a full high pulse width guaranteed. PCICLK ( $0: 4$ ) clock on latency cycles are only one rising PCICLK clock off latency is one PCICLK clock.

## Notes:

1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248 device.)
2. PCI_STOP\# is an asynchronous input, and metastable conditions may exist. This signal is required to be synchronized inside the ICS9248.
3. All other clocks continue to run undisturbed.
4. CPU_STOP\# is shown in a high (true) state.

## Renesns

## Shared Pin Operation Input/Output Pins

The I/O pins designated by (input/output) on the ICS924839 serve as dual signal functions to the device. During initial power-up, they act as input pins. The logic level (voltage) that is present on these pins at this time is read and stored into a 5 -bit internal data latch. At the end of Power-On reset, (see AC characteristics for timing values), the device changes the mode of operations for these pins to an output function. In this mode the pins produce the specified buffered clocks to external loads.

To program (load) the internal configuration register for these pins, a resistor is connected to either the VDD (logic 1) power supply or the GND (logic 0 ) voltage potential. A 10 Kilohm (10K) resistor is used to provide both the solid CMOS programming voltage needed during the power-up programming period and to provide an insignificant load on the output clock during the subsequent operating period.

Figure 1 shows a means of implementing this function when a switch or 2 pin header is used. With no jumper is installed the pin will be pulled high. With the jumper in place the pin will be pulled low. If programmability is not necessary, than only a single resistor is necessary. The programming resistors should be located close to the series termination resistor to minimize the current loop area. It is more important to locate the series termination resistor close to the driver than the programming resistor.

Fig. 1

## Renesns

## General Layout Precautions:

1) Use a ground plane on the top layer of the PCB in all areas not used by traces.
2) Make all power traces and vias as wide as possible to lower inductance.

Notes:
1 All clock outputs should have series terminating resistor. Not shown in all places to improve readibility of diagram
2 Optional EMI capacitor should be used on all CPU, SDRAM, and PCI outputs.
3 Optional crystal load capacitors are recommended.

## CapacitorValues:

C1, C2 : Crystal load values determined by user
C3:100pF ceramic
All unmarked capacitors are $0.01 \mu \mathrm{~F}$ ceramic
