

Direct Rambus™ Clock Generator

General Description

The **ICS9212-13** is a High-speed clock generator providing up to 600 MHz differential clock source for direct Rambus™ memory system. It includes DDLL (Distributed Delay locked loop) and phase detection mechanism to synchronize the direct Rambus™ channel clock to an external system clock. **ICS9212-13** provides a solution for a broad range of Direct Rambus memory applications. The device works in conjunction with the ICS9250-09.

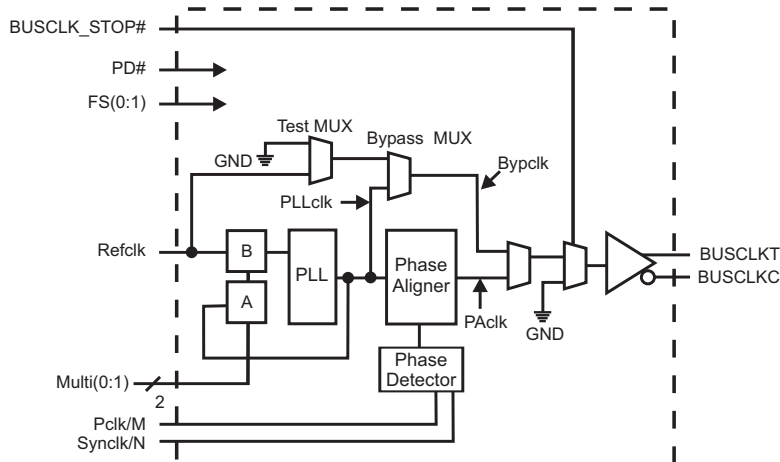

The **ICS9212-13** power management support system turns “off” the Rambus™ channel clock to minimize power consumption for mobile and other power-sensitive applications. In “clock off” mode the device remains “on” while the output is disabled, allowing fast transitions between clock-off and clock-on states. In “power down” mode it completely powers down for minimum power dissipation.

The **ICS9212-13** meets the requirements for input frequency tracking when the input frequency clock is using Spread Spectrum clocking and also the optimum bandwidth is maintained while attenuating the jitter of the reference signal.
