

## 85V/1.1A, High Efficiency Synchronous Step-Down Converter

### DESCRIPTION

ETA1805 is a high-efficiency DC-to-DC step-down switching regulator with up to 85V operation input voltage and up to 105V standoff voltage. It is capable of delivering up to 1.1A output current. ETA1805 adopts an adaptive COT control scheme that enables very fast transient response and provides a very smooth transition when the output varies from light load to heavy load. During light load, ETA1805 goes into a PFM mode that saves switching loss achieving high efficiency. The adaptive COT control also maintains a constant switching frequency across line and load.

ETA1805 is available in ESOP8 package.

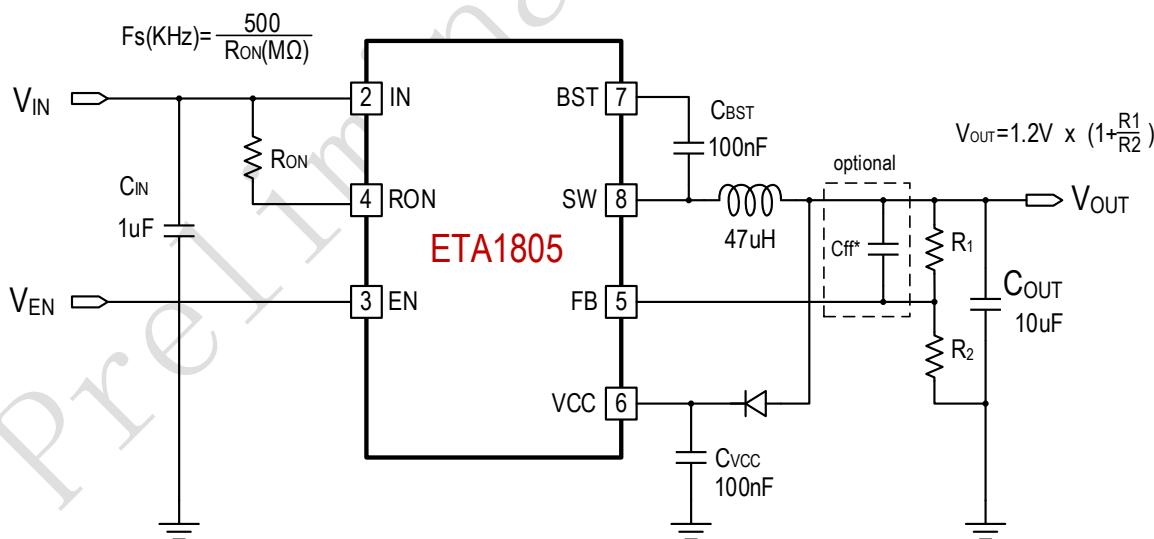

### FEATURES

- ◆ Wide Input Range: 7V-85V
- ◆ 105V Standoff Input Voltage
- ◆ Up to 1.1A Output Current
- ◆ Adaptive COT Control
- ◆ Ultra-fast Load Transient Response
- ◆ High Efficiency PFM Mode at Light Load
- ◆ Internal Power FETs
- ◆ Thermal Shutdown and UVLO
- ◆ Available in ESOP8 Package

### APPLICATIONS

- ◆ Non-Isolated Telecommunication Buck Regulator
- ◆ Secondary High Voltage Post Regulator
- ◆ Automotive Systems

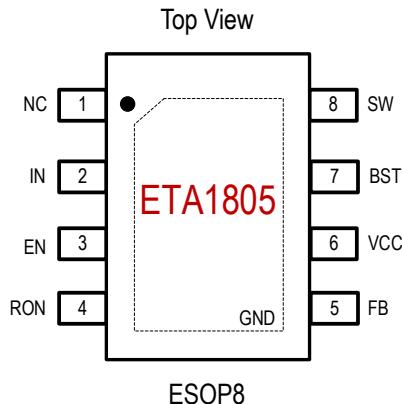

### TYPICAL APPLICATION

### ORDERING INFORMATION

PART No.	PACKAGE	TOP MARK	Pcs/Reel

## PIN CONFIGURATION

## ABSOLUTE MAXIMUM RATINGS

(Note: Exceeding these limits may damage the device. Exposure to absolute maximum rating conditions for long periods may affect device reliability.)

IN Voltage .....	105V
EN, RON, SW Voltage .....	$V_{IN} + 0.3V$
BST Voltage .....	SW+6V
FB Voltage.....	6V
VCC Voltage.....	30V
SW to ground current.....	Internally limited
Operating Temperature Range .....	-40°C to 85°C
Storage Temperature Range .....	-55°C to 150°C
Thermal Resistance $\theta_{JC}$ $\theta_{JA}$ ESOP8.....	10.....30 ..... °C /W
Lead Temperature (Soldering, 10sec) .....	260°C

## ELECTRICAL CHARACTERISTICS

( $V_{IN} = 48V$ ,  $V_{OUT} = 5V$ , unless otherwise specified. Typical values are at  $TA = 25^{\circ}C$ .)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNIT
Input Voltage Range		7	85		V
Input UVLO	Rising, Hysteresis = 500mV	6.6	7		V
Input Supply Current	$V_{FB}=1.3V$ , no switching	280	400		$\mu A$
Input Shutdown Current		7	14		$\mu A$
VCC Internal Voltage			4.2		V
FB Voltage		1.176	1.2	1.224	V
FB Input Current			0		$\mu A$
Switching Frequency Range	$F_{sw}(KHz) = 500/R_{ON}(Mohm)$	0.2	0.5		MHz
Minimum ON time			120		ns
Minimum Off time			350		ns
Short Circuit Hiccup Time	On Time	2			mS
	Off Time	13			mS
FB Hiccup Threshold		0.12			V
High Side Switch On Resistance		350			$m\Omega$
Low Side Switch On Resistance		200			$m\Omega$
High Side Current Limit		2			A
Low Side Current Limit		1.2			A
SW Leakage Current	$V_{IN} = V_{SW} = 12V$ , $V_{EN} = 0V$	10			$\mu A$
EN Rising Threshold	Rising	1.2			V
EN Falling Threshold	Falling	0.8			V

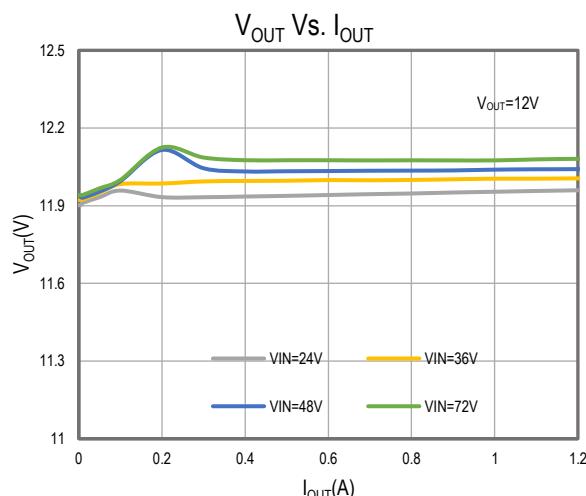

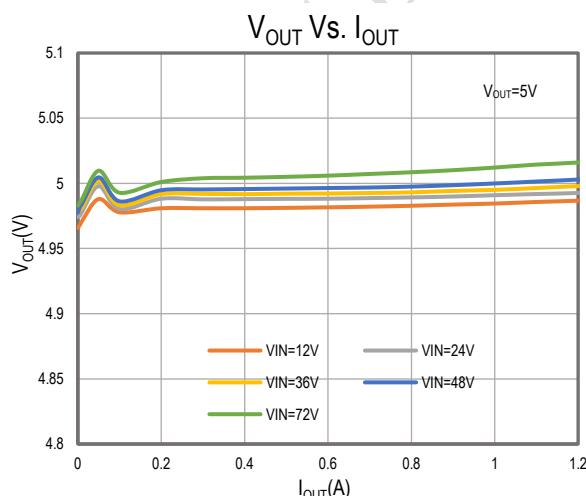

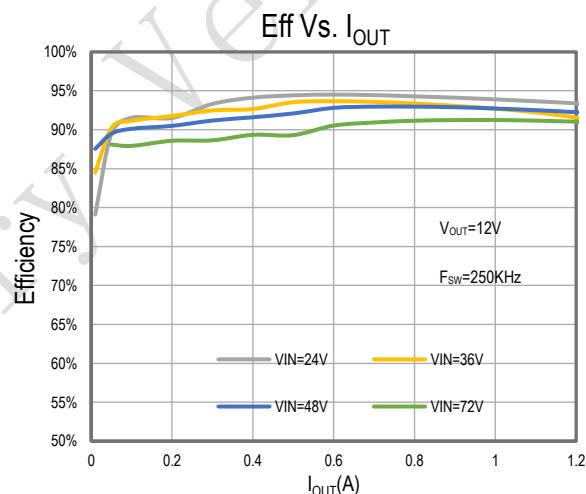

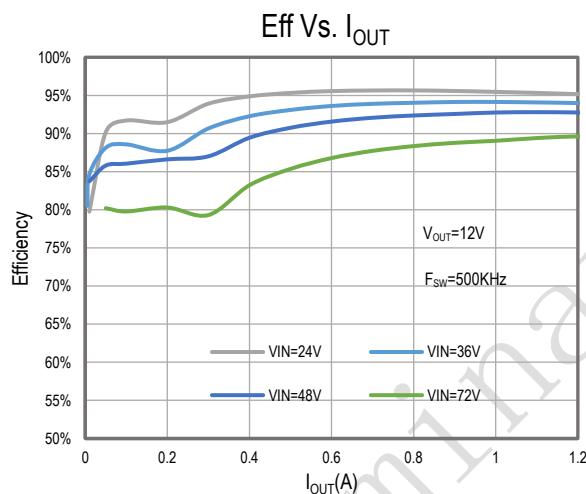

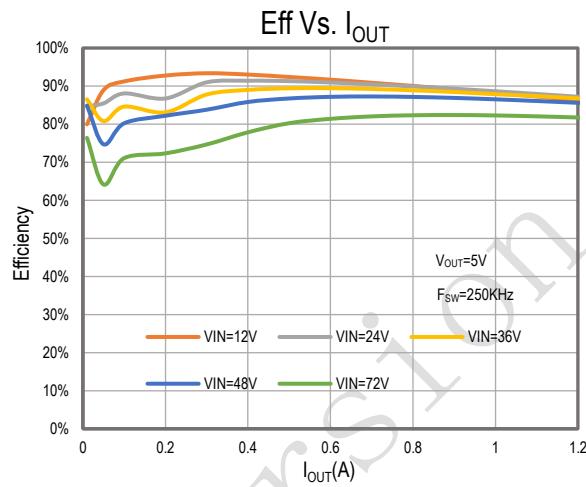

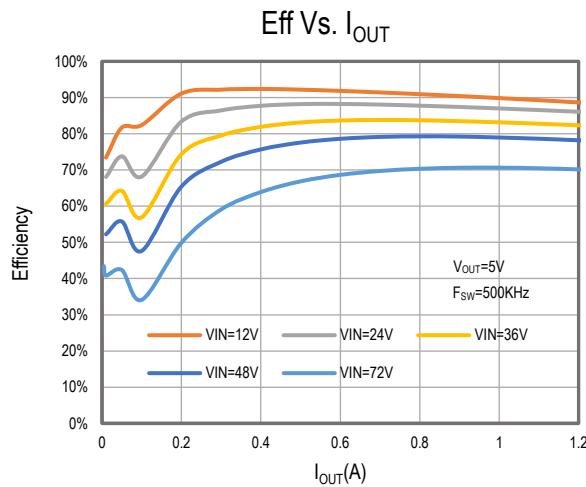

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNIT
EN Input Current	$V_{EN} = 2V$			15	uA
Thermal Shutdown	Rising, Hysteresis = $38^{\circ}C$			155	$^{\circ}C$

## PIN DESCRIPTION

PIN #	NAME	DESCRIPTION
1	NC	No connection
2	IN	Input power pin. Bypass to GND with a minimum 1uF capacitor.
3	EN	Enable pin. Pull high to enable, pull low to disable. It has an accurate threshold for setting UVLO externally.
4	RON	On Time programming pin. Connect a resistor from this pin to IN to set the on time or frequency.
5	FB	Feedback Input. Connect an external resistor divider from the output to FB and GND to set $V_{OUT}$
6	VCC	Power supply pin for internal circuit. Bypass with a 100nF capacitor.
7	BST	Bootstrap pin . Connect a 100nF capacitor from this pin to SW
8	SW	Inductor Connection for output . Connect an inductor Between SW and the regulator output.
Exposed Pad	GND	Ground pin

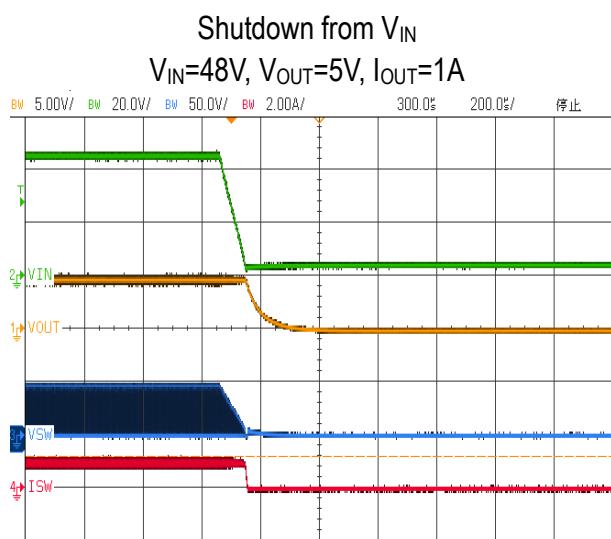

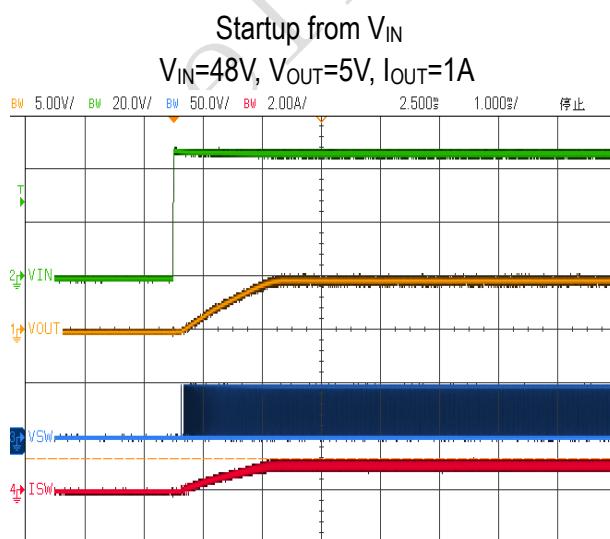

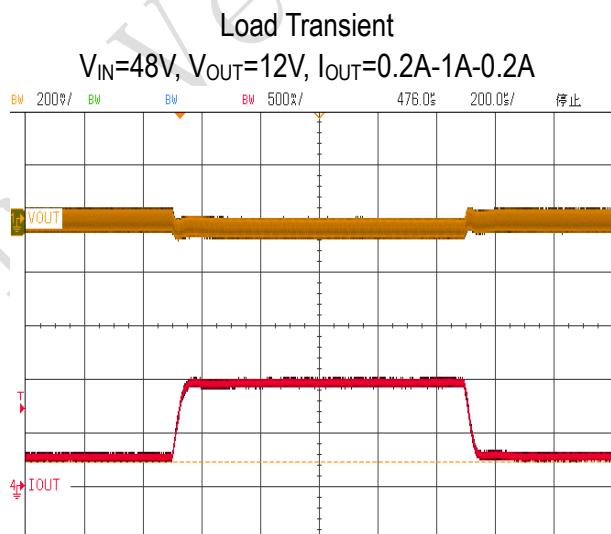

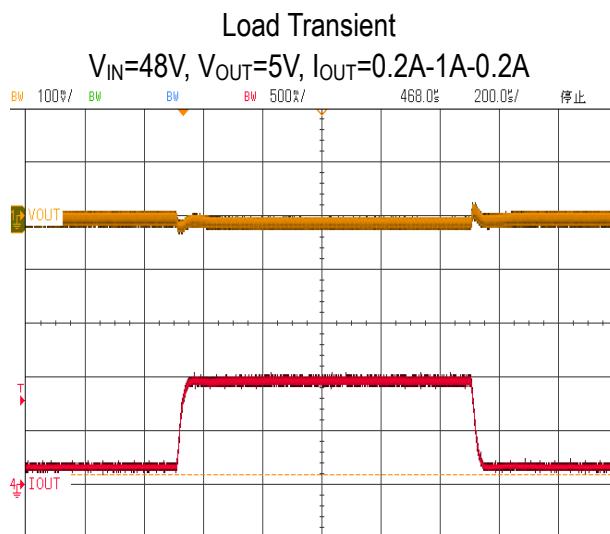

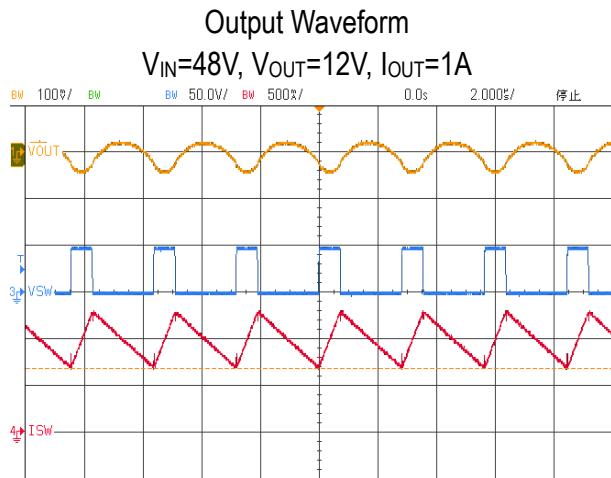

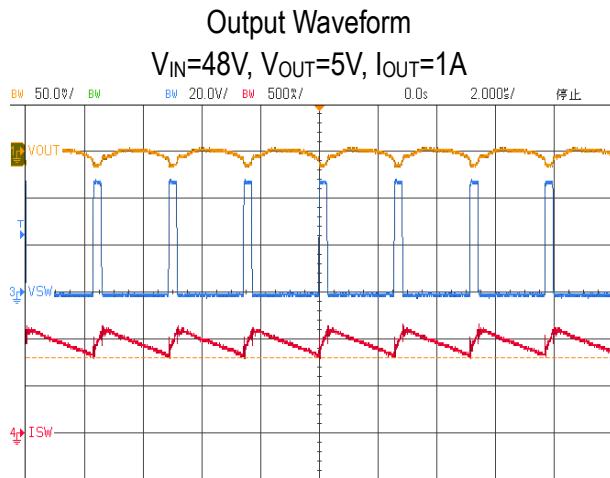

## TYPICAL CHARACTERISTICS

(Typical values are at  $T_A = 25^\circ\text{C}$  unless otherwise specified.)

## FUNCTIONAL DESCRIPTION

ETA1805 is a high efficiency DC-to-DC step-down switching regulator with operation input voltage up to 85V and standoff voltage up to 105V. It is capable of delivering up to 1.1A output current and adopts an adaptive COT control scheme.

### Light Load Operation

Traditionally, a fixed constant frequency PWM DC-DC regulator always switches even when the output load is small. When energy is shuffling back and forth through the power MOSFET, power is lost due to the finite  $R_{DS(on)}$  of the MOSFET and parasitic capacitances. At light load, switching loss is prominent and efficiency is therefore very low. ETA1805 goes into a power save mode during light load, thereby extending the range of high efficiency operation.

### **Enable**

EN is a digital control pin that turns the ETA1805 on and off. Driving EN High to turn on the regulator, Low to turn it off. Connecting the EN pin through a pull up resistor or shorting EN to IN will automatically turn on the chip whenever plug in IN.

### **Over Current Protection and Hiccup**

ETA1805 has a cycle-by-cycle over current limit for when the inductor current peak value is over the set current limit threshold. When the output voltage drop until FB falls below UV threshold (0.12V), the ETA1805 will enter hiccup mode. It will turn off the chip immediately for 13mS. After that, it will try to re-start as normal for 2mS. After 2mS, if FB is still below UV threshold, then the chip enters hiccup mode again. If FB is higher than UV threshold, it will enter the normal mode.

### **Over-Temperature Protection**

Thermal protection disables the output when the junction temperature rises to approximately 155°C, allowing the device to cool down. When the junction temperature cools to approximately 117°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits regulator dissipation, protecting the device from damage as a result of overheating.

### **External Output Voltage Setting**

In external Output Voltage Setting Version selected, the ETA1805 regulator is programmed using an external resistor divider. The output voltage is calculated using below equation.

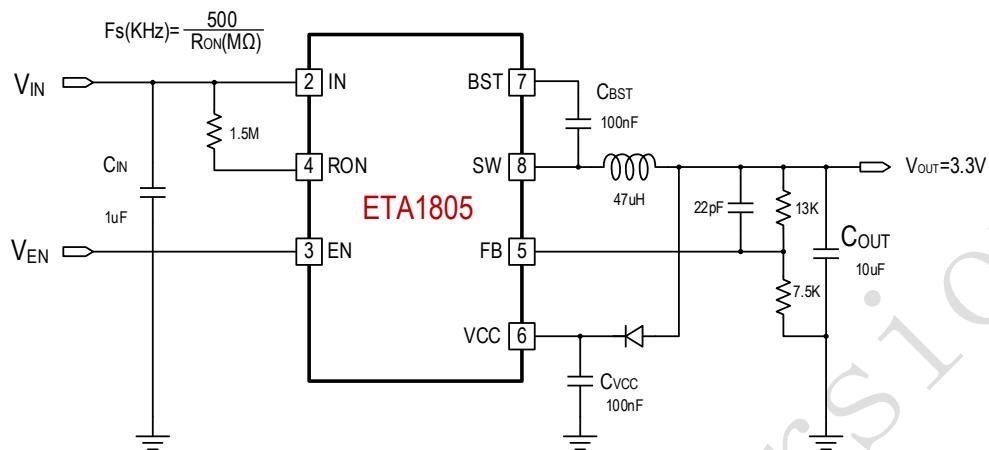

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R_1}{R_2}\right)$$

Where:  $V_{REF} = 1.2V$  typically (the internal reference voltage)

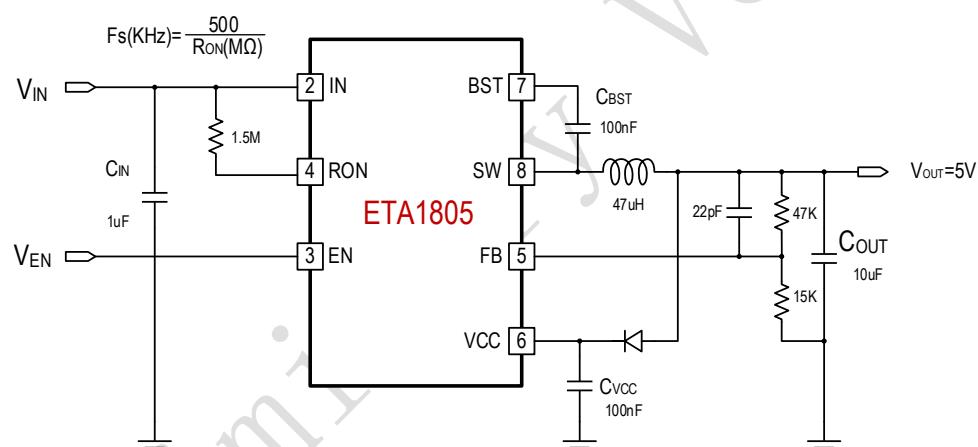

Resistors R2 has to be between 1Kohm to 20Kohm and thus R1 is calculated by following equation.

$$R_1 = \left(\frac{V_{OUT}}{V_{REF}} - 1\right) \times R_2$$

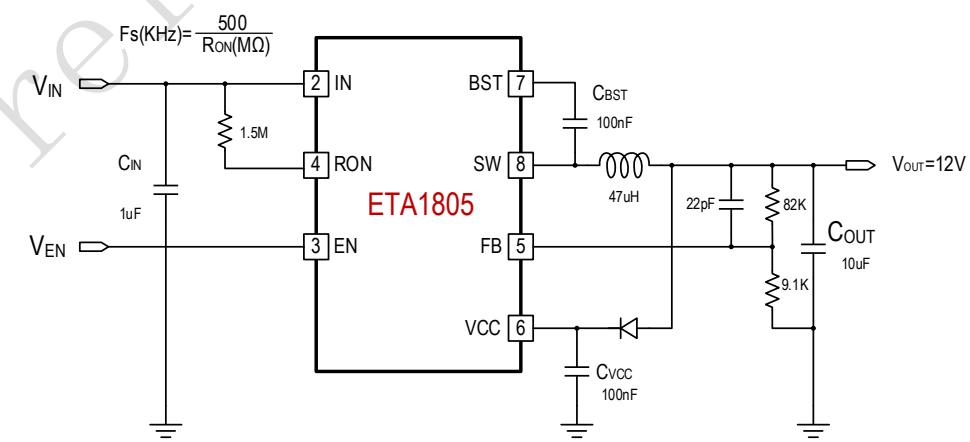

## Typical Application Circuit

$V_{IN}=48\text{V}$ ,  $V_{OUT}=3.3\text{V}$ ,  $F_{SW}=330\text{KHz}$ ,  $I_{OUT}=1.1\text{A}$

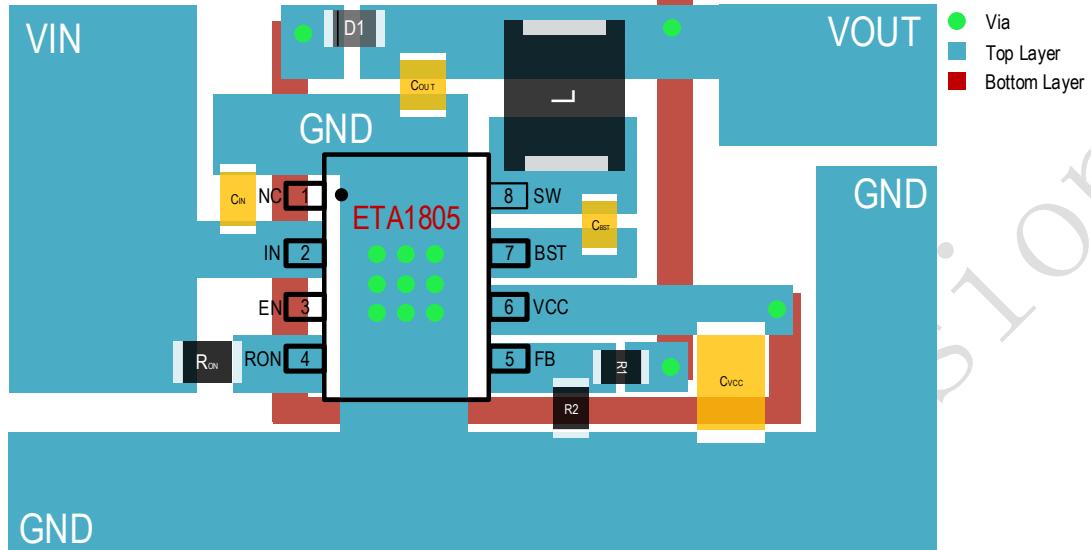

$V_{IN}=48\text{V}$ ,  $V_{OUT}=5\text{V}$ ,  $F_{SW}=330\text{KHz}$ ,  $I_{OUT}=1.1\text{A}$

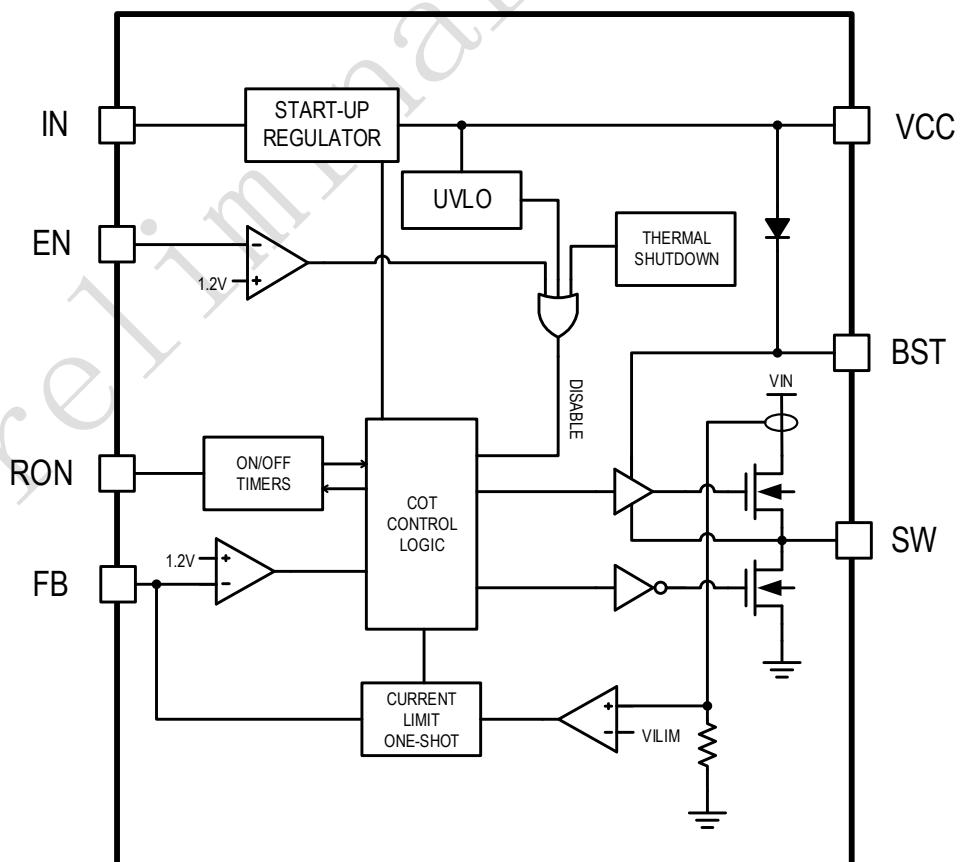

$V_{IN}=48\text{V}$ ,  $V_{OUT}=12\text{V}$ ,  $F_{SW}=330\text{KHz}$ ,  $I_{OUT}=1.1\text{A}$

## PCB GUIDELINES

Keep the power devices as close to the chip as possible to achieve the smallest power loop area, which leads to the best EMI performance;  $C_{in}$  is always placed nearest to  $V_{in}$  and GND
