# **BMA456**

16 bit, digital, triaxial acceleration sensor with intelligent on-chip motion-triggered interrupt features optimized for wearable applications.

### Key features

| • | Small package size              | LGA package (12 pins), footprint 2mm x 2mm,<br>height 0.65 mm   |
|---|---------------------------------|---|
| • | Digital interface               | SPI (4-wire, 3-wire), I <sup>2</sup> C, 2 interrupt pins<br>V <sub>DDIO</sub> voltage range: 1.2V to 3.6V   |
| • | Programmable functionality      | Acceleration ranges ±2g/±4g/±8g/±16g<br>Low-pass filter bandwidths 684Hz - <8Hz<br>up to a max. output data read out of 1.6 kHz   |
| ٠ | On-chip FIFO                    | Integrated FIFO on sensor with 1 kb   |
| • | On-chip interrupt features      | Step Counter optimized for wearable devices<br>Activity Recognition: Running, Walking, Still<br>Tilt-On-Wrist detection<br>Tap/Double tap interrupt<br>Any-/No-Motion interrupt |
| • | Ultra-low power                 | Low current consumption of data acquisition and all integrated features   |
| ٠ | (Secondary) Auxiliary Interface | Hub for ext. Magnetometer and data synchronization  |

RoHS compliant, halogen-free

# Typical applications

- Applications with height constrains
- Plug 'n' Play Step-Counter solution with watermark functionality
- Fitness applications / Activity Tracking
- Power management for wearable applications
- Display on/off and profile switching
- User interface without hardware buttons
- E-compass tilt compensation and data synchronization
- High performance angle measurements

# 3. Quick Start Guide

The purpose of this chapter is to help developers who want to start working with the BMA456 by giving you some very basic hands-on application examples to get started.

# Note about using the BMA456:

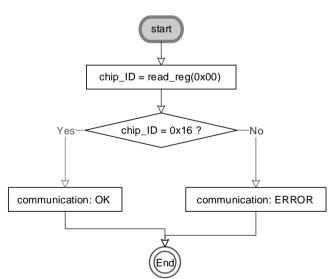

The communication between application processor and BMA456 will happen either over i2c or spi interface. For more information about the interfaces, read the related chapter 6.

• Before starting the test, the device has to be properly connected to the master (AP) and powered up. For more information about it, read the related chapter 7. Pin-out and Connection Diagrams.

# First application setup examples algorithms:

After correct power up by setting the correct voltage to the appropriate external pins, the BMA456 enters automatically into the Power On Reset (POR) sequence. In order to properly make use of the BMA456, certain steps from host processor side are needed. The most typical operations will be explained in the following application examples in form of flow-diagrams.

# Example 1: Testing communication with the BMA456 and initializing feature engine

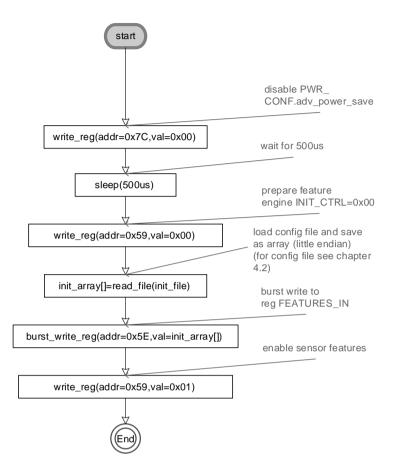

a. -reading chip id (checking correct communication)

b. -performing initialization sequence (interrupt feature engine)

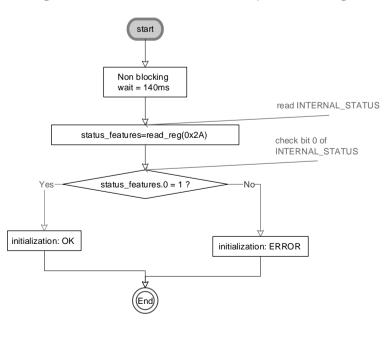

BST-BMA456-DS000-02 | Versi on 1.2 | April 2019

# Example 2: Reading acceleration data from BMA456 (example: low power mode)

-setting data processing parameters (power, bandwidth, range) and reading sensor data

#### Further steps:

The BMA456 has many more capabilities that are described in this document and include FIFO, power saving modes, synchronization capabilities with host processor, data synchronization and integration with third party sensors, many interrupts generation and more features like step counter, etc.

### 4.1. Supply Voltage and Power Management

BMA456 has two distinct power supply pins:

- VDD is the main power supply.
- VDDIO is a separate power supply pin used for supplying power for the interface including the auxiliary interface.

There are no limitations with respect to the voltage level applied to the VDD and VDDIO pins, as long as it lies within the respective operating range. Furthermore, the device can be completely switched off (VDD= 0V) while keeping the VDDIO supply within operating range or vice versa. However if the VDDIO supply is switched off, all interface pins (CSB, SDX, SCX) must be kept close to GNDIO potential. The device is reset when the supply voltage applied to at least one supply pin VDD or VDDIO falls below the specified minimum values. No constraints exist for the minimum slew-rate of the voltage applied to the VDD and VDDIO pins.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

# 4.2. Device Initialization

After power up sequence the accelerometer is in suspend mode, device must initialized through the following procedure. Initialization has to be performed as well after every POR or soft reset.

- Disable advanced power save mode: <u>PWR\_CONF.adv\_power\_save</u> =0b0
- Wait for 450 us. The register <u>SENSORTIME</u> 0 increments every 39.25 µsec and may be used for accurate timing.
- Write <u>INIT\_CTRL.init\_ctrl</u>=0x00
- Load configuration file
  - Burst write initialization data to Register <u>FEATURES\_IN</u>. The configuration file is included in the driver available on the Bosch Sensortec website (<u>www.bosch-sensortec.com</u>) or from your regional support team. Optionally the configuration file can be written to the Register <u>FEATURES\_IN</u> in several consecutive burst write access. Every burst write must contain an even number of bytes.
  - Optionally:
    - Burst read configuration file from Register FEATURES IN and check correctness
- Enable sensor features write 0x01 into register <u>INIT\_CTRL.init\_ctrl.</u> This operation must not be performed more than once after POR or softreset.
- Wait until Register <u>INTERNAL STATUS.message</u> contains the value 0b1. This will happen after at most 140-150 msec.

After initialization sequence has been completed, the device is in configuration mode (power mode). Now it is possible to switch to the required power mode and all features are ready to use as described in chapter 4.

# 4.3. Power Modes

The power state of the BMA456 is controlled through the registers <u>PWR CONF</u> and <u>PWR CTRL</u>. The Register <u>PWR CTRL</u> enables and disables the accelerometer and the auxiliary sensor. The Register <u>PWR CONF</u> controls which power state the sensors enter if they are enabled or disabled in the Register <u>PWR CTRL</u>. The power state impacts the behavior of the sensor with respect to start-up time, available functions, etc. but not the sensor data quality. The sensor data quality is controlled in the Registers <u>ACC CONF</u>.

In all global power configurations both register contents and FIFO contents are retained.

<u>Low Power Mode</u>: This power configuration aggressively reduces power of the device as much as possible. The low power mode configuration is activated through enabling <u>PWR CONF.adv power save</u>=0b1 and disabling <u>ACC CONF.acc perf mode</u>=0b0. In this configuration these externally user visible features may not be available:

- Register writes need an inter-write-delay of at least **1000 us**.
- The sensors log data into the FIFO in performance and low power mode. When the FIFO watermark interrupt is active, the FIFO is accessible for reading in low power mode until a burst read operation on Register <u>FIFO DATA</u> completes when <u>PWR CONF.fifo self wakeup</u>=0b1. When <u>PWR CONF.fifo self wakeup</u>=0b0, the user needs to disable advanced power save mode (<u>PWR CONF.adv power save</u>=0b0) before reading the FIFO and wait for 250 µs.
- To read out FIFO data w/o a FIFO watermark interrupt, the advanced power save configuration needs to be disabled (<u>PWR\_CONF.adv\_power\_save</u>=0b0)

The table below shows a few examples with the optimal power configurations

| Usecase                     | ACC CONF.acc perf mod | PWR CONF.adv power sa | PWR CTRL.acc en | Power consumption   |
|-----------------------------|-----------------------|-----------------------|-----------------|---------------------|
| Configuration mode          | х                     | 0                     | х               | tbd                 |
| Suspend (lowest power mode) | х                     | 1                     | 0               | suspend power       |
| Performance mode accel      | 1                     | х                     | 1               | accel power         |
| Low power mode              | 0                     | 1                     | 1               | Depends on ACC CONF |

The <u>PWR\_CTRL</u> register is used to enable and disable sensors. Per default, all sensors are disabled. Acceleration sensor must be enabled by setting <u>PWR\_CTRL.acc\_en</u>=0b1.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

The auxiliary sensor functionality is supported only when the auxiliary interface is connected for the auxiliary sensor operation. If the auxiliary interface is not used for auxiliary sensor operation, then the auxiliary sensor interface must remain disabled by setting <u>PWR\_CTRLaux\_en</u>=0b0 (default).

To change the power mode of the auxiliary sensor, both the power mode of the auxiliary interface and the auxiliary sensor part needs to be changed, e.g. to set the auxiliary sensor to suspend mode:

- Set the auxiliary sensor interface to suspend in Register <u>PWR CTRLaux en</u>=0b0. Changing the auxiliary sensor interface power mode to suspend does not imply any mode change in the auxiliary sensor.
- The auxiliary sensor part itself must be put into suspend mode by writing the respective configuration bits of the auxiliary sensor part. The power mode of the auxiliary sensor part is controlled by setting the BMA456 auxiliary sensor interface into manual mode by <u>AUX IF CONF.aux manual en</u>=0b1 and then communicating with the auxiliary sensor part through the BMA456 registers <u>AUX RD ADDR</u>, <u>AUX WR ADDR</u>, and <u>AUX WR DATA</u>. For details see Chapter 4.8.

### 4.4. Sensor Data

### Acceleration Data

The width of acceleration data is 16 bits given in two's complement representation in the registers <u>DATA 8</u> to <u>DATA 13</u>. The 16 bits for each axis are split into an MSB upper part and an LSB lower part. Reading the acceleration data registers shall always start with the LSB part. In order to ensure the integrity of the acceleration data, the content of an MSB register is locked by reading the corresponding LSB register (shadowing procedure).

# Filter Settings

The accelerometer digital filter can be configured through the Register ACC\_CONF.

Note:

Illegal settings in configuration registers will result in an error code in Register <u>ERR\_REG</u>. The content of the data register is undefined, and if the FIFO is used, it may contain no value.

# Accelerometer data processing for performance mode

Performance mode is enabled with <u>ACC\_CONF.acc\_perf\_mode</u>=0b1. In this power mode, the accelerometer data is sampled at equidistant points in the time, defined by the accelerometer output data rate parameter <u>ACC\_CONF.acc\_odr</u>. The output data rate can be configured in one of eight different valid ODR configurations going from 12.5 Hz up to 1600Hz.

The filter bandwidth shows a 3db cutoff frequency shown in the following table:

Table 12: 3dB cutoff frequency of the accelerometer according to ODR with normal filter mode

| 1 5                       |      |       |       | 0    |     |          |          |          |
|---------------------------|------|-------|-------|------|-----|----------|----------|----------|
| Accelerometer ODR [Hz]    | 12.5 | 25    | 50    | 100  | 200 | 400      | 800      | 1600     |
| 3dB Cutoff frequency [Hz] |      |       |       |      |     | 162      | 324      | 684      |
|                           | 5.06 | 10.12 | 20.25 | 40.5 | 80  | (155 for | (262 for | (353 for |
|                           |      |       |       |      |     | Z axis)  | Z axis)  | Z axis)  |

BST-BMA456-DS000-02 | Version 1.2 | April 2019

#### Accelerometer data processing for low power mode

Low be enabled by PWR CONF.adv power save=0b1 mode can and power ACC CONF.acc perf mode=0b0. In this power mode, the accelerometer regularly changes between a suspend power mode phase where no measurement is performed and a performance power mode phase, where data is acquired. The period of the duty cycle for changing between suspend and performance mode will be determined by the output data rate (ACC CONF.acc odr). The output data rate can be configured in one of 10 different valid ODR configurations going from 0.78Hz up to 400Hz. The samples acquired during the normal mode phase will be averaged and the result will be the output data. The number of averaged samples can be determined by the parameter ACC CONF.acc bwp through the following formula:

> averaged samples = 2<sup>(Val(acc\_bwp))</sup> skipped samples = (1600/ODR)-averaged samples

A higher number of averaged samples will result in a lower noise level of the signal, but since the performance power mode phase is increased, the power consumption will also rise.

### Data Ready Interrupt

This interrupt fires whenever a new data sample set from accelerometer, and auxiliary sensor is complete. This allows a low latency data readout. In non-latched mode, the interrupt and the flag in Register <u>INT\_STATUS\_1</u> are cleared automatically after 1/(3200Hz). If this automatic clearance is unwanted, latched-mode can be used (see chapter 4.7).

In order to enable/use the data ready interrupt map it on the desired interrupt pin via <u>INT\_MAP\_DATA</u>.

#### Temperature Sensor

The temperature sensor has 8 bits. The temperature value is defined in Register <u>TEMPERATURE</u> and updated every 1.28 s.

It is always on, when a sensor is active.

| Value | Temperature |
|-------|-------------|
| 0x7F  | 150 °C      |
|       |             |
| 0x00  | 23 °C       |
|       |             |
| 0x81  | -104 °C     |
| 0x80  | Invalid     |

When there is no valid temperature information available (i.e. last measurement before the time defined above), the temperature indicates an invalid value: 0x80.

BST-BMA456-DS000-02 | Versi on 1.2 | April 2019

Bosch Sensortec

#### **Sensor Time**

The BMA456 supports the concept of sensortime. Its core element is a free running counter with a width of 24 bits. It increments with a resolution of 39.0625us. The user can access the current state of the counter by reading registers SENSORTIME 0 to SENSORTIME 2.

All sensor events e.g. updates of data registers are synchronous to this sensor time register as defined in the table below. With every update of the data register or the FIFO, a bit m in the registers <u>SENSORTIME 0</u> to <u>SENSORTIME 2</u> toggles where m depends on the output data rate for the data register and the output data rate and the FIFO downsampling rate for the FIFO. The table below shows which bit toggles for which update rate of data register and FIFO

| Bit m in sensor_time | 23     | 22     | 21    | 20    | 19    | 18    | 17   | 16   |
|----------------------|--------|--------|-------|-------|-------|-------|------|------|
| Resolution [s]       | 327.68 | 163.84 | 81.92 | 40.96 | 20.48 | 10.24 | 5.12 | 2.56 |
| Update rate [Hz]     | 0.0031 | 0.0061 | 0.012 | 0.024 | 0.049 | 0.10  | 0.20 | 0.39 |
|                      |        |        |       |       |       |       |      |      |
|                      |        |        |       |       |       |       |      |      |

| Bit <i>m</i> in sensor_time | 15   | 14   | 13    | 12   | 11   | 10 | 9  | 8   | 7   | 6   | 5     | 4     | 3      | 2     | 1     | 0     |
|-----------------------------|------|------|-------|------|------|----|----|-----|-----|-----|-------|-------|--------|-------|-------|-------|
| Resolution [ms]             | 1280 | 640  | 320   | 160  | 80   | 40 | 20 | 10  | 5   | 2.5 | 1.250 | 0.625 | 0.3125 | 0.156 | 0.078 | 0.039 |
| Update rate [Hz]            | 0.78 | 1.56 | 3.125 | 6.25 | 12.5 | 25 | 50 | 100 | 200 | 400 | 800   | 1600  | 3200   |       |       |       |

The sensortime is synchronized with the data capturing in the data register and the FIFO. Between the data sampling and the data capturing there is a delay which depends on the settings in the Register <u>ACC\_CONF</u>. The sensortime supports multiple seconds of sample counting and a sub-microsecond resolution, see Register <u>SENSORTIME\_0</u> for details.

Burst reads on the registers <u>SENSORTIME\_0</u> to <u>SENSORTIME\_2</u> deliver always consistent values, i.e. the value of the register does not change during the burst read.

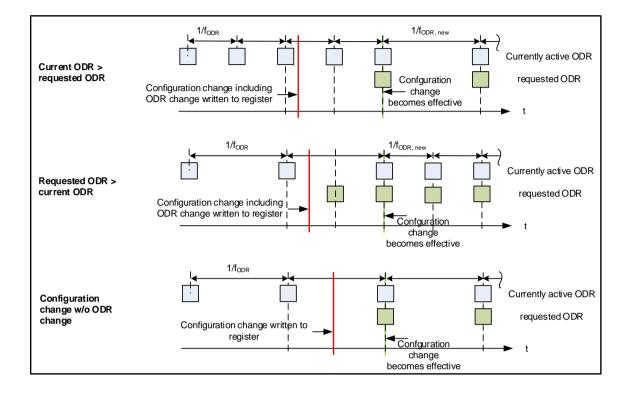

### **Configuration Changes**

If accelerometer configuration settings in registers <u>ACC\_CONF</u>, <u>ACC\_RANGE</u>, or <u>AUX\_CONF</u> are changed while the accelerometer (<u>PWR\_CTRLacc\_en</u> = 0b1) or auxiliary sensor (<u>PWR\_CTRLaux\_en</u> = 0b1) is enabled, the configuration changes are not immediately applied. The configuration changes become effective if a sampling event for the currently active ODR coincides with a sampling event for the newly requested ODR on the sensortime sampling grid. In the case where the currently active ODR equals the newly requested ODR, the configuration changes become effective at the next sampling event. See also following figure.

# 4.5. FIFO

The device supports the following FIFO operating modes:

- Streaming mode: overwrites oldest data on FIFO full condition
- FIFO mode: discards newest data on FIFO full condition

The FIFO depth is 1024 byte and supports the following interrupts:

- FIFO full interrupt
- FIFO watermark interrupt

FIFO is enabled with <u>FIFO\_CONFIG\_1.fifo\_acc\_en</u>=0b1 (0b0= disabled). To enable the FIFO for the auxiliary interface (magnetometer) set <u>FIFO\_CONFIG\_1.fifo\_aux\_en</u>=0b1 (0b0=disabled).

# Frames

The FIFO captures data in frames, which consist of a header and a payload. The FIFO can be configured to skip the header (headerless mode) in which case only payload is stored.

- In header mode (standard configuration) each regular frame consists of a one byte header describing properties of the frame, (which sensors are included in this frame) and the data itself. Beside the regular frames, there are control frames.
- In headerless mode the FIFO contains sampled data only.

# Header mode

The header has a length of 8 bit and the following format:

| Bit     | 7       | 6     | 5        | 4     | 3 | 2 | 1         | 0  |
|---------|---------|-------|----------|-------|---|---|-----------|----|
| Content | fh_mode | <1:0> | fh_parm< | <3:0> |   |   | fh_ext<1: | 0> |

These *fh\_mode* and *fh\_parm* and *fh\_ext* fields are defined below

| fh_mode<1:0>  | Definition | fh_parm <3:0>   | fh_ext<1:0>          |
|---------------|------------|-----------------|----------------------|
| 0b10          | Regular    | Enabled sensors | Tag of INT2 and INT1 |
| 0b01          | Control    | Control opcode  |                      |
| 0b00 and 0b11 | Reserved   | Na              |                      |

f\_parm=0b0000 is invalid for regular mode, a header of 0x80 indicates an uninitialized frame.

In a regular frame, fh\_parm frame defines which sensors are included in the data part of the frame. The format is

| Name    | fh_parm<3:0> |               |          |               |
|---------|--------------|---------------|----------|---------------|
| Bit     | 3            | 2             | 1        | 0             |
| Content | Reserved     | FIFO_aux_data | Reserved | FIFO_acc_data |

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

When FIFO\_<sensor x>\_data is 0b1 (0b0) data for sensor x is included (not included) in the data part of the frame.

The fh\_ext<1:0> field are used for external tagging.

The data format for data frames is identical to the format defined for the <u>Register (0x0A) DATA 0</u> to <u>Register (0x17) DATA 13</u> register. Only frames which contain data of at least one sensor will be written into the FIFO. E.g. fh\_parm=0b0101 the data in the frame are shown below. If the read burst length is less than 8 byte, the number of auxiliary sensor data in the frame is reduced to the burst length.

| DATA[X] | Acronym           |   |
|---------|-------------------|---|
| X=0     | AUX_0             | copy of register Val( <u>AUX_RD_ADDR</u> ) in auxiliary sensor register map   |
| X=1     | AUX_1             | copy of register Val( <u>AUX_RD_ADDR</u> )+1 in auxiliary sensor register map |
| X=2     | AUX_2             | copy of register Val( <u>AUX_RD_ADDR</u> )+2 in auxiliary sensor register map |
| X=3     | AUX_3             | copy of register Val( <u>AUX_RD_ADDR</u> )+3 in auxiliary sensor register map |
| X=4     | AUX_4             | copy of register Val( <u>AUX_RD_ADDR</u> )+4 in auxiliary sensor register map |
| X=5     | AUX_5             | copy of register Val( <u>AUX_RD_ADDR</u> )+5 in auxiliary sensor register map |
| X=6     | AUX_6             | copy of register Val( <u>AUX_RD_ADDR</u> )+6 in auxiliary sensor register map |
| X=7     | AUX_7             | copy of register Val(AUX RD ADDR)+7 in auxiliary sensor register map          |
| X=8     | ACC_X<7:0> (LSB)  |   |
| X=9     | ACC_X<15:8> (MSB) |   |
| X=10    | ACC_Y<7:0> (LSB)  |   |
| X=11    | ACC_Y<15:8> (MSB) |   |
| X=12    | ACC_Z<7:0> (LSB)  |   |
| X=13    | ACC_Z<15:8> (MSB) |   |

# Headerless mode

When the data rates of all enabled sensor elements are identical, the FIFO header may be disabled in <u>FIFO\_CONFIG\_1.fifo\_header\_en</u>.

The headerless mode supports only regular frames. To be able to distinguish frames from each other, all frames must have the same size. For this reason, any change in configuration that have an impact to frame size or order of data within a frame will cause an instant flush of FIFO, restarting capturing of data with the new settings.

BST-BMA456-DS000-02 | Versi on 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

If the auxiliary sensor interface is enabled, the number of auxiliary sensor bytes in a FIFO frame is always <u>AUX IF CONF.aux rd burst</u> bytes (see chapter 4.8). If the burst length is less than 8, BMA456 will pad the values read form the auxiliary sensor. E.g. if <u>AUX IF CONF.aux rd burst</u>=0b01 (2 Bytes), a frame with auxiliary sensor and accelerometer data will look like

| DATA[X] | Acronym           |   |
|---------|-------------------|---|
| X=0     | AUX_0             | copy of register Val( <u>AUX_RD_ADDR.read_addr</u> ) in auxiliary sensor register map   |
| X=1     | AUX_1             | copy of register Val( <u>AUX RD ADDR.read addr</u> +1) in auxiliary sensor register map |
| X=2     | Padding byte      | Undefined value   |
| X=3     | Padding byte      | Undefined value   |
| X=4     | Padding byte      | Undefined value   |
| X=5     | Padding byte      | Undefined value   |
| X=6     | Padding byte      | Undefined value   |
| X=7     | Padding byte      | Undefined value   |
| X=8     | ACC_X<7:0> (LSB)  |   |
| X=9     | ACC_X<15:8> (MSB) |   |
| X=10    | ACC_Y<7:0> (LSB)  |   |
| X=11    | ACC_Y<15:8> (MSB) |   |
| X=12    | ACC_Z<7:0> (LSB)  |   |
| X=13    | ACC_Z<15:8> (MSB) |   |

# **Conditions and Details**

#### Frame rates

The frame sampling rate of the FIFO is defined by the maximum output data rate of the sensors enabled for FIFO sampling. The FIFO sampling configuration is set in register <u>FIFO CONFIG 0</u> to <u>FIFO CONFIG 1</u>. It is possible to select filtered or pre-filtered data as an input to the FIFO. If unfiltered data are selected in register <u>FIFO DOWNS.acc fifo filt data</u> for the accelerometer, the sample rate is 1600 Hz. The input data rate to the FIFO can be reduced by selecting a down-sampling factor  $2^{k}$  in register <u>FIFO DOWNS.acc fifo downs</u>, where k=[0,1..7].

# FIFO Overflow

In the case of overflow the FIFO can either stop recording data or overwrite the oldest data. The behavior is controlled by Register <u>FIFO CONFIG 0.fifo stop on full</u>. When

<u>FIFO CONFIG 0.fifo stop on full</u> =0b0, the FIFO logic may delete the oldest frames. If header mode is enabled, the skip frame is the prepended at the next FIFO readout, when the free FIFO space falls below the maximum size frame.

If <u>FIFO CONFIG 0.fifo stop on full</u> =0b1, the newest frame may be discarded, if the free FIFO space falls below the maximum size frame. If header mode is enabled, a skip frame is prepended at the next FIFO readout (which is **not** the position where the frame(s) have been discarded). During a FIFO read operation of the host, no data at the FIFO tail may be dropped. If the host reads the FIFO with a slower rate than it is filled, it may happen that the sensor needs to drop new data, even when <u>FIFO CONFIG 0.fifo stop on full</u> =0b0. These events are recorded in the Register <u>ERR\_REG.fifo\_err</u>.

### Control frames

Control frames are only supported in header mode. There are a number of control frames defined through the *fh\_parm* field. These are shown in below.

A skip frame indicates the number of skipped frames after a FIFO overrun occurred, a sensortime frame contains the sensortime when the last sampled frame stored in the FIFO is read, a FIFO input config frames indicates a change in sensor configuration which affects the sensor data. The FIFO fill level is contained in registers <u>FIFO LENGTH 1.fifo byte counter 13 8</u> and <u>FIFO LENGTH 0.fifo byte counter 7 0</u> and includes the control frames, with the exception of the sensortime frame.

| fh_mode<3:0> | Definition              |
|--------------|-------------------------|
| 0x0          | Skip Frame              |
| 0x1          | Sensortime Frame        |
| 0x2          | Fifo_Input_Config Frame |
| 0x3          | Reserved                |
| 0x4          | Sample Drop Frame       |
| 0x5 – 0x7    | Reserved                |

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. #### Skip Frame (fh\_parm=0x0):

In the case of FIFO overflows, a skip\_frame is prepended to the FIFO content, when read out next time. The data for the frame consists of one byte and contains the number of skipped frames. When more than 0xFF frames have been skipped, 0xFF is returned. A skip frame is expected always as first frame in a FIFO read burst. A skip frame does not consume memory in the FIFO.

### Sensortime Frame (fh\_parm=0x1):

The data for the sensortime frame consists content of the Register <u>SENSORTIME 0</u> to <u>SENSORTIME 2</u> when the last byte of the last sample frame was read. A sensortime frame is always expected as last frame in the FIFO. A sensortime frame is only sent if the FIFO becomes emptyduring the burst read. A sensortime frame does not consume memory in the FIFO. Sensortime frames are enabled (disabled) by setting <u>FIFO CONFIG 0.fifo time en</u> to 0b1 (0b0).

### Fifo\_Input\_Config Frame (fh\_parm=0x2):

Whenever the filter configuration of the FIFO input data sources changes, a FIFO input config frame is inserted into the FIFO, before the configuration change becomes active. E.g. when the bandwidth for the accelerometer filter is changed in Register <u>ACC\_CONF</u>, a FIFO input config frame is inserted before the first frame with accelerometer data with the new bandwidth configuration. The FIFO input config frame contains one byte of data with the format

| Bit     | 7     | 6   | 5             | 4               | 3        | 2        | 1                | 0               |
|---------|-------|-----|---------------|-----------------|----------|----------|------------------|-----------------|
| Content | reser | ved | aux_<br>if_ch | aux_<br>conf_ch | reserved | reserved | acc_<br>range_ch | acc_<br>conf_ch |

aux\_if\_ch: A write to Register <u>AUX\_IF\_CONF</u>, <u>AUX\_RD\_ADDR</u>, or <u>AUX\_WR\_ADDR</u> becomes active. aux\_conf\_ch: A write to Register <u>AUX\_CONF</u> becomes active.

acc range ch: A write to Register ACC RANGE becomes active.

acc\_conf\_ch: A write to Register <u>ACC\_CONF</u> or acc\_FIFO\_filt\_data or acc\_FIFO\_downsampling in Register <u>FIFO\_DOWNS</u> becomes active.

### Sample Drop Frame

A sample drop frame has always one byte payload, defined through

| Bit     | 7     | 6   | 5 | 4 | 3 | 2        | 1        | 0            |
|---------|-------|-----|---|---|---|----------|----------|--------------|
| Content | resei | ved |   |   |   | aux_drop | reserved | acc_<br>drop |

Sample drop frame will be inserted after a Fifo\_Input\_Configframe at the ODR tick at which the sample was dropped and only if no other sensor provides a valid sample at this ODR tick. If another sensor provides valid data, the data of this sensor is just not included and the appropriate header bit of the data frame is not set.

BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

Sample drop frames will be inserted only for transition phases after configuration changes, not for samples dropped between sensor enable and first valid sample. For a detailed description of configuration changes see Section 4.4, Subsection "Configuration Changes".

# FIFO Partial frame reads

When a frame is only partially read through the Register <u>FIFO\_DATA</u> it will be repeated completely with the next access both in headerless and in header mode. In headermode, this includes the header. In the case of a FIFO overflow between the first partial read and the second read attempt, the frame may be deleted.

# FIFOoverreads

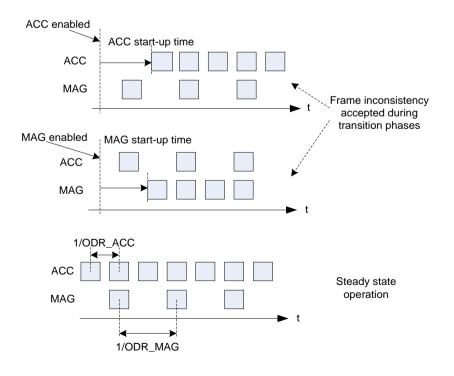

When more data are read from the FIFO than it contains valid data, 0x8000 is returned in headerless mode. In header mode 0x80 indicates an invalid frame.

# FIFO data synchronization

All sensor data are sampled with respect to a common ODR time grid. Even if a different ODR is selected for the acceleration and the magnetic sensor the data remains synchronized:

If a frame contains a sample from a sensor element with ODR x, then it must contain also samples of all sensor elements with an ODR y>=x. This applies for steady state operation. In transition phases, it is more important not to lose data, therefore exceptions are possible if the sensor elements with ODR y>=x. do not have data, e.g. due to a sensor configuration change.

FIFO Data Synchronization Scheme in the following figure illustrates the steady state and transient operating conditions.

### FIFO synchronization with external interrupts

External interrupts may be synchronized into the FIFO data. For this operation mode the <u>FIFO CONFIG 1.fifo tag int1 en and FIFO CONFIG 1.fifo tag int2 en need to be enabled, as well as INT1 IO CTRLinput en and INT2 IO CTRLinput en</u>. The fh\_ext field in FIFO header will then be set according to the signal at the INT1/INT2 inputs.

# FIFO Interrupts

The FIFO supports two interrupts, a FIFO full interrupt and a watermark interrupt:

- The FIFO full interrupt is issued when the FIFO fill level is above the full threshold. The full threshold is reached just before the last two frames are stored in the FIFO.
- The FIFO watermark is issued when the FIFO fill level is equal or above a watermark defined in Register <u>FIFO\_WTM\_0</u> and <u>FIFO\_WTM\_1</u>.

In order to enable/use the FIFO full or watermark interrupts map them on the desired interrupt pin via INT\_MAP\_DATA.

Both interrupts are suppressed when a read operation on the Register <u>FIFO\_DATA</u> is ongoing. Latched FIFO interrupts will only get cleared, if the status register gets read and the fill level is below the corresponding FIFO interrupt (full or watermark).

# FIFO Reset

The user can trigger a FIFO reset by writing the command fifo\_flash (0xB0) in <u>CMD</u>. Automatic resets are only performed in the following cases:

- A sensor is enabled or disabled in headerless mode
- A transition between headerless and headermode or vice versa has occurred.
- Size of auxiliary sensor data in a frame changed in header or headerless mode

# 4.6. Interrupt Features

# **Global Configuration**

The configuration of the interrupt feature engine is described in the Register <u>FEATURES IN</u>. In order to reconfigure the features, the user must perform a burst read of the whole content from the Register <u>FEATURES IN</u>, followed by a modification of the content, and finally a burst write of the modified content to the Register <u>FEATURES IN</u>. The content of the successive bytes read or written in burst mode correspond to the single bytes 0x00 to 0x3F described in <u>FEATURES IN</u>.

Make sure sensor is initialized properly before the feature configuration is performed (see description in chapter 4.2.)

The output of the interrupt features can be read out of the status registers listed below.

| •   | •                              |  |
|---|--------------------------------|--|
| Feature   | Output status                  |  |
| Step Detector/Counter                                 | INT STATUS 0.step counter out  |  |
| Activity Recognition                                  | INT STATUS 0.activity type out |  |
| Tilt on wrist   | INT STATUS 0.wrist tilt out    |  |
| Double Tap / Tap                                      | INT STATUS 0.wakeup out        |  |
| Any Motion / No Motion INT STATUS 0.any no motion out |                                |  |
| Error Interrupt                                       | INT STATUS 0.error int out     |  |

### Interrupt feature status registers

Additionally, the Step counter numeric value is stored in the registers: <u>STEP\_COUNTER 0</u>, <u>STEP\_COUNTER 1</u>, <u>STEP\_COUNTER 2</u> and <u>STEP\_COUNTER 3</u>.

The Error Interrupt signals that the sensor stopped after a fatal error. The Device reinitialization must be done.

The Features (algorithms) have as input data the acceleration samples, which are acquired at 50Hz.

### Minimum Bandwidth Settings

If Performance mode is enabled (<u>ACC\_CONF.acc\_perf\_mode</u> is 0b1, so continuous mode is used), then the features are functioning correctly, regardless to the ODR and the Bandwidth that the Host would set.

If Performance Mode is disabled (<u>ACC\_CONF.acc\_perf\_mode</u> is 0b0) (device in low power mode), then the minimum ODR setting must comply with the following restrictions:

1. The ODR must be set to minimum 50 Hz for the most features except Double Tap/Tap

2. The ODR must be set to minimum 200 Hz for the use of Double Tap/ Tap feature

If the minimum requirements are not met, the corresponding flag from the register INTERNAL STATUS is set.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. Axes remapping for interrupt features

If the sensor orientation is different than described in chapter 8.2 the sensor axis must be remapped to use the integrated features.

Axes remapping register allows the host to freely map individual axis to the coordinate system of the used platform. Individual axis can be mapped to any other defined axis. The sign value of the axis can be also configured. For example x axis can be mapped to -x axis, +y axis, -y axis, +z axis or -z axis. Similarly other axis also have its own combination.

# Note:

The axis remapping does apply only to the data fetched into the Features. The <u>DATA 0</u> to <u>DATA 13</u> registers and FIFO are not affected and should be accordingly remapped on the driver level.

Configuration settings:

- 1. <u>FEATURES IN.general settings.axes remapping.map x axis</u> describes which axis shall be mapped to x axis.
- 2. <u>FEATURES IN.general settings.axes remapping.map x axis sign</u> describes whether the mapped axis shall be inverted or not to be inverted.
- 3. <u>FEATURES IN.general settings.axes remapping.map y axis</u> describes which axis shall be mapped to y axis.
- 4. <u>FEATURES IN.general settings.axes remapping.map y axis sign</u> describes whether the mapped axis shall be inverted or not to be inverted.
- 5. <u>FEATURES IN.general settings.axes remapping.map z axis</u> –describes which axis shall be mapped to z axis.
- 6. <u>FEATURES IN.general settings.axes remapping.map z axis sign</u> describes whether the mapped axis shall be inverted or not to be inverted.

### Step Detector/Step Counter

The Step Counter algorithm is optimized on high accuracy, while Step Detector is optimized on low latency. Both are running in parallel, once enabled, but the Step Detector interrupt output is mutually exclusive with the Step Counter watermark interrupt. The Step Counter is optimized for wearable devices and wrist use case.

In addition the Step Counter implements the function required for step counting in Android 4.4 and higher as well: https://source.android.com/devices/sensors/sensor-types.html#step\_counter.

The Step Detector implements the function required for step counting in Android 4.4 and higher: https://source.android.com/devices/sensors/sensor-types.html#step\_detector.

### Step Counter:

Step Counter can be enabled in <u>FEATURES\_IN.step\_counter.settings\_26.en\_counter.</u>

The step counter accumulates the steps detected by the step detector interrupt, and makes available the 32 bit current step counter value in the following 4 registers, each holding 8bit: <u>STEP COUNTER 0</u>, <u>STEP COUNTER 1</u>, <u>STEP COUNTER 2</u> and corresponding, <u>STEP COUNTER 3</u>. There are situations when the step counting value is different than the sum of steps detected by the step detector.

By enabling the FEATURES IN.step counter.settings 26.reset counter flag, the accumulated step number value is reset. Afterwards, the value of this flag is automatically reset and counting is restarted. The step counter watermark option can be useful if host needs to receive an interrupt every time a certain number of steps were counted. If FEATURES IN.step counter.settings 26.watermark level is set to 10 (holding an implicit factor of 20x), every 200 steps are counted an interrupt will be raised on INT STATUS 0.step counter out. As the steps are buffered internally, the output may be triggered between 200-210 steps. The exact number of steps recorded is available in the registers STEP COUNTER 0, STEP COUNTER 1, STEP COUNTER 2 and STEP COUNTER 3. When level the watermark was reached, the corresponding interrupt bit is asserted, INT STATUS 0.step counter out.

### Step Detector:

The Step Detector feature is optimized for low latency. If <u>FEATURES IN.step counter.settings 26.en detector</u> is set, an interrupt is triggered for every step detected. So, every time a new step is detected, it asserts the corresponding interrupt output <u>INT\_STATUS\_0.step\_counter\_out</u>.

# Step Counter Presets (phone/wrist use case):

The integrated step counter can be configured to work with either phone platform or wrist platform. The step counter parameters <u>FEATURE IN.step counter.settings 1.param 1</u> to <u>FEATURE IN.step counter.settings 25.param 25</u> must be configured from the host side to either of the configurations in the following table.

| PARAM_19       | 12                  | 12                  |
| PARAM_20       | 15600               | 15600               |
| PARAM_21       | 256                 | 256                 |
| PARAM_22       | 0                   | 1                   |
| PARAM_23       | 0                   | 3                   |
| PARAM_24       | 0                   | 1                   |
| PARAM_25       | 0                   | 14                  |

By default, the wrist configuration is available for use. If the platform is a wrist operated device, then there is no need to overwrite the step counter parameter values. If the configuration needs to be modified then the following steps must be followed:

1. Disable step counter, step detector, and activity detection

2. Modify the 25 parameters of step counter

3. Enable step counter, step detector, and activity detection

After re-enabling the features, the new parameters value will be used.

Customized Step Counter Sensitivity Configuration (overwrites Step Counter Presets)

The Step Counter and Detector sensitivity can be modified manually by setting the step counter parameters in the register map with the support of the corresponding field application engineer. The default parameters are set by the step counter preset (phone/wrist) which is used.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

Bosch Sensortec

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

Configuration settings:

- 1. <u>FEATURES IN.step counter.settings 26.watermark level</u> Watermark level; the Stepcounter will trigger output every time this number of steps are counted. Holds implicitly a 20x factor, so the range is 0 to 20460, with resolution of 20 steps. If 0, the Step Counter watermark is disabled and Step Detector enabled.
- 2. <u>FEATURES IN.step counter.settings 26.reset counter</u> flag to reset the counted steps. This is only interpreted if the step counter is enabled.
- 3. <u>FEATURES IN.step counter.settings 26.en counter</u> indicates if the Step Counter feature is enabled or not.
- 4. <u>FEATURES IN.step counter.settings 26.en detector</u> indicates if the Step Detector feature is enabled or not.

<u>FEATURES IN.step counter.settings 1.param 1</u> – there are 25 parameters, which configure the use case (wrist or phone).

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. # Walking activity recognition

This feature can detect the actual walking activity status of a user. It can distinguish between walking, running and still.

The change of the status can be read in <u>INT\_STATUS\_0.activity\_type\_out</u>; the status itself can be read in <u>ACTIVITY\_TYPE.activity\_type\_out</u>. The walking activity\_recognition can be enabled by <u>FEATURES\_IN.step\_counter.settings\_26.en\_activity</u>. Step counter has to be enabled as well by <u>FEATURES\_IN.step\_counter\_settings\_26.en\_counter</u>.

# Configuration settings:

FEATURES\_IN.step\_counter.settings\_26.en\_activity – enables walking activity recognition.

#### Tilt on Wrist

How to perform the "Tilt on Wrist" gesture ideally:

- 1. Wrap the device on your wrist.
- 2. Lift the hand wearing the device up to a comfortable position and tilt it to minimum 12° to gravity (see the image below for the valid position)
- 3. Wait for a second.

Valid position for Tilt on Wrist

The Tilt on Wrist Interrupt is detected with one accelerometer axis. Therefore, you should make sure that the active axis is mapped to the portrait up direction of the device by using the axis remapping functionality of BMA456. See the examples in the table below.

The table below shows the required remapping configurations for the Tilt on Wrist function based on the sensor's different orientations inside the device. More information about how to remap the axis direction can be found in the general interrupt description in Chapter 4.6.

| No. | Sensor direction                  | Mount<br>layer | Register configuration  | Remarks  |
|-----|-----------------------------------|----------------|---|--|

## Double tap / Tap detection

The gesture "Tap / Double tap" can be enabled by <u>FEATURES IN.tap doubletap.settings.enable</u>. The detection is done by measuring the acceleration on z-direction.

By default double tap detection is enabled. To enable single tap detection (and disable double tap), you can configure the parameter: <u>FEATURES\_IN.tap\_doubletap.settings.single\_tab\_en</u> - 1 bit - flag.

The detection sensitivity can be customized using the register <u>FEATURES\_IN.tap\_doubletap.settings.sensitivity</u>. The sensitivity range is from 0 (high) to 7 (low).

How to perform the gesture ideally:

- 1. Use your index finger to tapon the device slightly harder than how you touch a button on a touchscreen.
- 2. Tap again directly, if "Double tap" detection is enabled.
- 3. Wait for half a second.

#### Configuration settings

1. <u>FEATURES\_IN.tap\_doubletap.settings.enable</u>-enables/disables the Wakeup feature.

2. <u>FEATURES IN.tap doubletap.settings.sensitivity</u> – configures the detection sensitivity which ranges from 0 (high) to 7 (low).

3. <u>FEATURES IN.tap doubletap.settings.single tab en</u>-enables single tap detection. By default, double tap is enabled.

## Any Motion / No motion detection

#### Any Motion Detection:

The any-motion detection uses the slope between two acceleration signals to detect changes in motion. configured by at one of the The interrupt is setting least following flags: FEATURES IN.any motion.settings 2.en x, FEATURES IN.any motion.settings 2.en y and FEATURES IN.any motion.settings 2.en z, respectively for each axis.

It generates an interrupt when the absolute value of the slope (the difference between two accelerations) exceeds the preset <u>FEATURES IN.any motion.settings 1.threshold</u> for a certain number, <u>FEATURES IN.any motion.settings 2.duration</u>, of consecutive data points.

Any-motion (slope) interrupt detection

The slope (difference) is being computed between the current acceleration sample and the reference sample. The reference sample is updated while the Anymotion is detected; basically this means the reference is the last state when sensor detected Anymotion.

If the same number of data points falls below the <u>FEATURES IN.any motion.settings 1.threshold</u>, the interrupt is reset.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

#### No Motion Detection:

The interrupt engine can also be configured as a No-motion interrupt, when register <u>FEATURES IN.any motion.settings 1.nomotion sel</u> is set.

No-motion is generated when the slope on all selected axis remains smaller than a programmable <u>FEATURES IN.any motion.settings 1.threshold</u> for a programmable time. The signals and timings relevant to the no-motion interrupt functionality are depicted in the figure below.

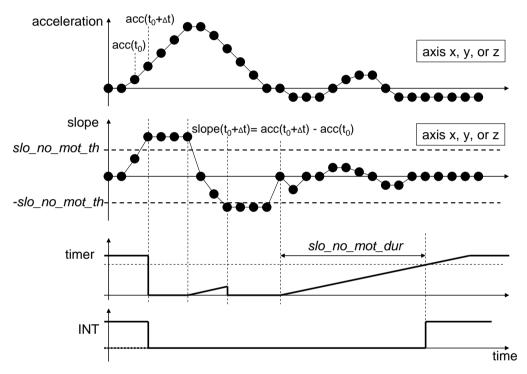

Figure 1 Signal timings No-motion interrupt

Register <u>FEATURES IN.any motion.settings 2.duration</u> defines the number of consecutive slope data points of the selected axis which must exceed the threshold for an interrupt to be asserted.

#### Configuration settings:

- 1. <u>FEATURES IN.any motion.settings 2.duration</u> the number of consecutive data points for which the threshold condition must be respected, for interrupt assertion.
- 2. <u>FEATURES IN.any motion.settings 1.threshold</u> the slope threshold.
- 3. FEATURES IN.any motion.settings 2.en x indicates if this feature is enabled for x axis
- 4. <u>FEATURES IN.any motion.settings 2.en y</u> indicates if this feature is enabled for y axis
- 5. FEATURES IN.any motion.settings 2.en z -indicates if this feature is enabled for z axis
- 6. FEATURES IN.any motion.settings 1.nomotion sel indicates if No-motion (1) or Anymotion (0) is selected.

## 4.7. General Interrupt Pin configuration

## **Electrical Interrupt Pin Behavior**

Both interrupt pins INT1 and INT2 can be configured to show the desired electrical behavior.

Interrupt pins can be enabled in <u>INT1\_IO\_CTRL.output\_en</u> respectively <u>INT2\_IO\_CTRL.output\_en</u>.

The characteristic of the output driver of the interrupt pins may be configured with bits <u>INT1 IO CTRL.od</u> and <u>INT2 IO CTRL.od</u>. By setting these bits to 0b1, the output driver shows opendrive characteristic, by setting the configuration bits to 0b0, the output driver shows push-pull characteristic.

The electrical behavior of the Interrupt pins, whenever an interrupt is triggered, can be configured as either "active-high" or "active-low" via <u>INT1\_IO\_CTRL.IV</u> respectively <u>INT2\_IO\_CTRL.IV</u>.

Both interrupt pins can be configured as input pins via <u>INT1 IO CTRL.input en</u> respectively <u>INT2 IO CTRL.input en</u>. This is necessary when FIFO tag feature is used (see chapter 0). If both are enabled, the input (e.g. marking FIFO) is driven by the interrupt output.

BMA456 supports edge and level triggered interrupt inputs, this can be configured through INT1 IO CTRL.edge ctrl respectively INT2 IO CTRL.edge ctrl.

BMA456 supports non-latched and latched interrupts modes for data-ready, FIFO full and FIFO watermark. The mode is selected by <u>INT\_LATCH.int\_latch</u>. The feature interrupts described in chapter 4.6 support only latched mode described below.

In latched mode an asserted interrupt status in <u>INT\_STATUS\_0</u> or <u>INT\_STATUS\_1</u> and the selected pin are cleared if the corresponding status register is read. If more than one interrupt pin is used in latched mode, all interrupts in <u>INT\_STATUS\_0</u> should be mapped to one pin and all interrupts in <u>INT\_STATUS\_1</u> should be mapped to the other pin. If just one interrupt pin is used all interrupts may be mapped to this pin. If the activation condition still holds when it is cleared, the interrupt status is asserted again when the interrupt condition holds again.

In the non-latched mode (only for data-ready, FIFO full and FIFO watermark) the interrupt status bit and the selected pin are reset as soon as the activation condition is not valid anymore.

#### Interrupt Pin Mapping

In order, for the Host to react to the features output, they can be mapped to the external PIN1 or PIN2, by setting the corresponding bits from the registers <u>INT1\_MAP</u>, respectively <u>INT2\_MAP</u>. To disconnect the features outputs to the external pins, the same corresponding bits must be reset, from the registers, <u>INT1\_MAP</u>, respectively <u>INT2\_MAP</u>.

Once a feature triggered the output pin, the Host can read out the corresponding bit from the register, <u>INT\_STATUS\_0</u> (Feature Interrupts) or <u>INT\_STATUS\_1</u> (FIFO and data ready).

#### 4.8. Auxiliary Sensor Interface

The auxiliary interface allows to attach one auxiliary sensor (e.g. magnetometer) on dedicated auxiliary sensor interface as shown in Figure...

6-DOF Solution w/ BMA456 and BMM150

#### Structure and Concept

The BMA456 controls the data acquisition of the auxiliary sensor and presents the data to the application processor through the primary I2C or SPI interface. No other I2C master or slave devices must be attached to the auxiliary sensor interface.

The BMA456 autonomously reads the sensor data from a compatible auxiliary sensor without intervention of the application processor and stores the data in its data registers and FIFO. The initial setup of the auxiliary sensor after power-on is done through indirect addressing.

The main benefits of the auxiliary sensor interface are

- Synchronization of sensor data of auxiliary sensor and accelerometer. This results in an improved sensor data fusion quality.
- Usage of the BMA456 FIFO for auxiliary sensor data (BMM150 does not have a FIFO). This is important for monitoring applications.

## Interface Configuration

The configuration registers that control the auxiliary sensor interface operation, are only affecting the interface to the auxiliary sensor, not the configuration of the sensor itself (this must be done in setup mode).

There are three basis configurations of the auxiliary sensor interface:

- No auxiliary sensor access
- Setup mode: Auxiliary sensor access in manual mode
- Data mode: Auxiliary sensor access through hardware readout loop.

The setup of the auxiliary sensor itself must be done through the primary interface using indirect addressing in setup mode. When collecting sensor data, the BMA456 autonomously triggers the

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

measurement of the auxiliary sensor using the auxiliary sensor forced mode and the data readout from the auxiliary sensor (data mode).

In setup mode, the auxiliary sensor may be configured and trim data may be read out from the auxiliary sensor. In the data mode the auxiliary sensor data are continuously copied into BMA456 registers and may be read out from BMA456 directly over the primary interface. For a BMM150 magnetometer, these are the auxiliary sensor data itself and Hall resistance, temperature is not required. The table below shows how to configure these three modes using the registers <u>PWR CONF</u>, <u>PWR CTRL</u>, and <u>AUX IF CONF.aux manual en</u>.

| Mode         | AUX IF CONF.aux manual en | PWR CONF.adv power save | PWR CTRL.aux en |
|--------------|---------------------------|-------------------------|-----------------|
| No auxiliary | 1                         | 1                       | 0               |
| sensor       |                           |                         |                 |
| access       |                           |                         |                 |
| Setup mode   | 1                         | 0                       | 0               |
| Data mode    | 0                         | x                       | 1               |

The auxiliary sensor interface mode may be enabled by setting bit <u>IF CONF.if mode</u> according to the following table.

| IF_CONF.if_mode | Result                          |
|-----------------|---------------------------------|
| 0               | Secondary IF disabled (default) |
| 1               | AuxlF enabled                   |

The auxiliary sensor interface operates at 400 kHz. This results in an I2C readout delay of about 250 us for 10 bytes of data.

## Setup mode (<u>AUX\_IF\_CONF.aux\_manual\_en</u> =0b1)

Through the primary interface the auxiliary sensor may be accessed using indirect addressing through the AUX\_\* registers. <u>AUX\_RD\_ADDR</u> and <u>AUX\_WR\_ADDR</u> define the address of the register to read/write in the auxiliary sensor register map and triggers the operation itself, when the auxiliary sensor interface is enabled through <u>PWR\_CTRL.aux\_en</u>.

For reads, the number of data bytes defined in <u>AUX\_IF\_CONF.aux\_rd\_burst</u> are read from the auxiliary sensor and written into the BMA456 Register <u>DATA\_0</u> to <u>DATA\_7</u>. For writes only single bytes are written, independent of the settings in <u>AUX\_IF\_CONF.aux\_rd\_burst</u>. The data for the I2C write to auxiliary sensor must be stored in <u>AUX\_WR\_DATA</u> before the auxiliary sensor register address is written into <u>AUX\_WR\_ADDR</u>.

When a read or write operation is triggered by writing to <u>AUX RD ADDR</u> and <u>AUX WR ADDR</u>, <u>STATUS.aux man op</u> is set and it is reset when the operation is completed. For reads the <u>DATA 0</u> to <u>DATA 7</u> contains the read data, for writes <u>AUX WR DATA</u> may be overwritten again.

## Data mode (AUX\_IF\_CONF.aux\_manual\_en=0)

<u>AUX\_RD\_ADDR.read\_addr</u> defines the address of the data register from which to read the number of data bytes configured in <u>AUX\_IF\_CONF.aux\_rd\_burst</u> from AUX\_0... AUX\_7 data of the auxiliary sensor. These data are stored in the <u>DATA\_0</u> up to <u>DATA\_7</u> register. The data ready status is set in <u>STATUS.drdy\_aux</u>, it is typically cleared through reading one of the <u>DATA\_0</u> to <u>DATA\_7</u> registers. <u>AUX\_WR\_ADDR.write\_addr</u> defines the register address of auxiliary sensor to start a measurement in forced mode in the auxiliary sensor register map. The delay (time\_offset) between triggering an auxiliary sensor measurement and reading the measurement data is specified in <u>AUX\_CONF.aux\_offset</u>. Reading of the data is done in a single I2C read operation with a burst length specified in <u>AUX\_IF\_CONF.aux\_rd\_burst</u>. For BMM150 <u>AUX\_IF\_CONF.aux\_rd\_burst</u> should be set to 0b11, i.e. 8 bytes. If <u>AUX\_IF\_CONF.aux\_rd\_burst</u> is set to a value lower than 8 bytes, the remaining auxiliary sensor data in the Register <u>DATA\_0</u> to <u>DATA\_7</u> and the FIFO are undefined.

It is recommended to disable the auxiliary sensor interface (IF <u>CONF.if</u> <u>mode</u>=0b0) before setting up <u>AUX RD ADDR.read</u> addr and <u>AUX WR ADDR.write</u> addr for the data mode. This does not put the auxiliary sensor itself into suspend mode but avoids gathering unwanted data during this phase. Afterwards the auxiliary sensor interface can be enabled (IF <u>CONF.if</u> mode=0b1) again.

# Delay (Time Offset)

BMA456 supports starting the measurement of the sensor at the auxiliary sensor interface between 2.5 and 37.5 ms before the Register DATA are updated. This offset is defined in <u>AUX\_CONF.aux\_offset</u>. If set to 0b0, the measurement is done right after the last Register DATA update, therefore this measurement will be included in the next register DATA update.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

#### 4.9. Sensor Self-Test

The BMA456 has a comprehensive self test function for the MEMS element by applying electrostatic forces to the sensor core instead of external accelerations. By actually deflecting the seismic mass, the entire signal path of the sensor can be tested. Activating the self-test results in a static offset of the acceleration data; any external acceleration or gravitational force applied to the sensor during active self-test will be observed in the output as a superposition of both acceleration and self-test signal.

Before the self-test is enabled the g-range should be set to 8g. The self-test is activated for all axes by writing <u>ACC SELF TEST.acc self test en</u> = 1b1. The self-test is disabled by writing <u>ACC SELF TEST.acc self test en</u> = 1b0. It is possible to control the direction of the deflection through bit <u>ACC SELF TEST.acc self test sign</u>. The excitation occurs in positive (negative) direction if <u>ACC SELF TEST.acc self test sign</u> = 1b1 ('b0). The amplitude of the deflection has to be set low by writing <u>ACC SELF TEST.acc self test amp</u> = 1b0. After the self-test is enabled, the user should wait 50ms before interpreting the acceleration data.

In order to ensure a proper interpretation of the self-test signal it is recommended to perform the self-test for both (positive and negative) directions and then to calculate the difference of the resulting acceleration values. The table below shows the minimum differences for each axis in order for the self test to pass. The actually measured signal differences can be significantly larger.

Self-test: Resulting minimum difference signal for BMA456.

|         | x-axis signal | y-axis signal | z-axis signal |
|---------|---------------|---------------|---------------|
| BM A456 | 1800 mg       | 1800 mg       | 1800 mg       |

It is recommended to perform a reset of the device after a self-test has been performed. If the reset cannot be performed, the following sequence must be kept to prevent unwanted interrupt generation: disable interrupts, change parameters of interrupts, wait for at least 50ms, and enable desired interrupts.

The recommended self test procedure is as follows:

- 1. Enable accelerometer with register <u>PWR\_CTRL.acc\_en</u>=1b1.
- 2. Set ±8g range in register ACC RANGE.acc range
- 3. Set self test amplitude to low by setting <u>ACC\_SELF\_TEST.acc\_self\_test\_amp</u> = 1b0
- 4. Set <u>ACC\_CONF.acc\_odr=1600Hz</u>, Continuous sampling mode, <u>ACC\_CONF.acc\_bwp</u>=norm\_avg4, <u>ACC\_CONF.acc\_perf\_mode</u>=1b1.
- 5. Wait for > 2 ms
- 6. Enable self-test and set <u>positive</u> self-test polarity (<u>ACC\_SELF\_TEST.acc\_self\_test\_sign</u>=1b1)
- 7. Wait for > 50ms
- 8. Read and store positive acceleration value of each axis from registers DATA 8 to DATA 13
- Enable self-test and set <u>negative</u> self-test polarity <u>ACC\_SELF\_TEST.acc\_self\_test\_sign</u>= 1b0)
- 10. Wait for > 50ms
- 11. Read and store negative acceleration value of each axis from registers DATA 8 to DATA 13
- 12. Calculate difference of positive and negative acceleration values and compare against threshold values

## 4.10. Offset Compensation

BMA456 offers manual compensation as well as inline calibration.

Offset compensation is performed with pre-filtered data, and the offset is then applied to both, prefiltered and filtered data. If necessary the result of this computation is saturated to prevent any overflow errors (the smallest or biggest possible value is set, depending on the sign).

The public offset compensation Registers <u>OFFSET 0</u> to <u>OFFSET 2</u> are images of the corresponding registers in the NVM. With each image update the contents of the NVM registers are written to the public registers. The public registers can be overwritten by the user at any time.

The offset compensation registers have a width of 8 bit using two's complement notation. The offset resolution (LSB) is 3.9 mg and the offset range is + - 0.5 g. Both are independent of the range setting. Offset compensation needs to be enabled through <u>NV\_CONF.acc\_off\_en</u> = 0b1

## Manual Offset Compensation

The contents of the public compensation Register <u>OFFSET 0</u> to <u>OFFSET 2</u> may be set manually via the digital interface. After modifying the Register <u>OFFSET 0</u> to <u>OFFSET 2</u> the next data sample is not valid.

Offset compensation needs to be enabled through <u>NV\_CONF.acc\_off\_en</u>.

#### Inline Calibration

For certain applications, it is often desirable to calibrate the offset once and to store the compensation values permanently. This can be achieved by using manual offset compensation to determine the proper compensation values and then storing these values permanently in the NVM.

Each time the device is reset, the compensation values are loaded from the non-volatile memory into the image registers and used for offset compensation.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

## 4.11. Non-Volatile Memory

The registers <u>NV\_CONF</u> and <u>OFFSET\_0</u> to <u>OFFSET\_2</u> have an NVM backup which are accessible by the user.

The content of the NVM is loaded to the image registers after a reset (either POR or softreset). As long as the image update is in progress, <u>STATUS.cmd\_rdy</u> is 0b0, otherwise it is 0b1.

The image registers can be read and written like any other register.

Writing to the NVM is a 4-step procedure:

- 1. Set <u>PWR CONF.adv power save</u> = 0b0
- 2. Write the new contents to the image registers.
- 3. Write 0b1 to bit <u>NVM\_CONF.nvm\_prog\_en</u> in order to unlock the NVM.
- 4. Write *prog\_nvm* to the <u>CMD</u> register to trigger the write process.

Writing to the NVM always renews the entire NVM contents. It is possible to check the write status by reading <u>STATUS.cmd rdy</u>. While <u>STATUS.cmd rdy</u> = 0b0, the write process is still in progress; when <u>STATUS.cmd rdy</u> = 0b1, writing is completed. An NVM write cycle can only be initiated, if <u>PWR\_CONF.adv power\_save</u> = 0b0.

Until boot phase is finished (after POR or softreset), the serial interface is not operational. The NVM shadow registers must not be accessed during an ongoing NVM command (initiated through the Register <u>CMD</u>). In all other cases, register can be read or written.

As long as an NVM read (during sensor boot and soft reset) or an NVM write is ongoing, writes to sensor registers are discarded, reads return the Register <u>STATUS</u> independent of the read address.

## 4.12. Soft-Reset

A softreset can be initiated at any time by writing the command *softreset (0xB6)* to register <u>CMD</u>. The softreset performs a fundamental reset to the device which is largely equivalent to a power cycle. Following a delay, all user configuration settings are overwritten with their default state (setting stored in the NVM) wherever applicable. This command is functional in all operation modes but must not be performed while NVM writing operation is in progress.

| Reset Value | 0                       | 0        | 0        | 0          |  |  |
| Content     | error_code              |          | cmd_err  | fatal_err  |  |  |

fatal\_err: Fatal Error, chip is not in operational state (Boot-, power-system). This flag will be reset only by power-on-reset or softreset.

cmd\_err: Command execution failed.

error\_code: Error codes for persistent errors

| error_code |          |                            |
|------------|----------|----------------------------|
| 0x00       | no_error | no error is reported       |
| 0x01       | acc_err  | error in Register ACC_CONF |

fifo\_err: Error in FIFO detected: Input data was discarded in stream mode. This flag will be reset when read.

# 6. Digital Interfaces

# 6.1. Interfaces

Beside the standard primary interface (I2C and SPI configurable), where sensor acts as a slave to the application processor, BMA456 supports an auxiliary interface. See picture below.

If the auxiliary interface is enabled, the BMA456 can be connected to an external sensor (e.g. a magnetometer) in order to build a 6-DoF solution. Then the BMA456 will act as a master to the external sensor, reading the sensor data automatically and providing it to the application processor via the primary interface.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

© Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. #### 6.2. Primary Interface

By default, the BMA456 operates in I2C mode. The BMA456 interface can also be configured to operate in a SPI 4-wire configuration. It can also be re-configured by software to work in 3-wire mode instead of 4-wire mode.

All 3 possible digital interfaces share partly the same pins. The mapping for the primary interface of the BMA456 is given in the following table:

| Pin# | Name | l/O Type    | Description   | Connect to (Primary IF) |                     |                                 |  |
|------|------|-------------|---|-------------------------|---------------------|---------------------------------|--|
|      |      |             |   | in SPI4W                | in SPI3W            | in I2C                          |  |
| 1    | SDO  | Digital I/O | Serial data output in SPI<br>Address select in I <sup>2</sup> C mode<br>see chapter 7.2                     | SDO                     | DNC (float)         | GND for<br>default I2C<br>addr. |  |
| 2    | SDX  | Digital I/O | SDA serial data I/O in I <sup>2</sup> C<br>SDI serial data input in SPI 4W<br>SDA serial data I/O in SPI 3W | SDI                     | SDA                 | SDA                             |  |
| 5    | INT1 | Digital I/O | Interrupt output 1 (default)<br>(Input for external FIFO sync) *  | INT1<br>(FIFO sync)     | INT1<br>(FIFO sync) | INT1<br>(FIFO sync)             |  |
| 6    | INT2 | Digital I/O | Interrupt output 2 (default)<br>(Input for external FIFO sync) *  | INT2<br>(FIFO sync)     | INT2<br>(FIFO sync) | INT2<br>(FIFO sync)             |  |
| 10   | CSB  | Digital in  | Chip select for SPI mode  | CSB                     | CSB                 | VDDIO                           |  |
| 12   | SCX  | Digital in  | SCK for SPI serial dock<br>SCL for I <sup>2</sup> C serial dock   | SCK                     | SCK                 | SCL                             |  |

\* INT1 and/or INT2 can also be configured as an input in case the external data synchronization in FIFO is used. See chapter 0. If INT1 and/or INT2 are not used, please do not connect them (DNC).

The following table shows the electrical specifications of the interface pins:

| Parameter   | Symbol          | Condition                                  | Min | Тур | Max | Units |
|---|-----------------|--|-----|-----|-----|-------|

#### 6.3. Primary Interface I2C/SPI Protocol Selection

The protocol is automatically selected based on the chip select CSB pin behavior after power-up.

At reset/power-up, BMA456 is in I2C mode. If CSB is connected to VDDIO during power-up and not changed the sensor interface works in I2C mode. For using I2C, it is recommended to hard-wire the CSB line to VDDIO. Since power-on-reset is only executed when, both VDD and VDDIO are established, there is no risk of incorrect protocol detection due to power-up sequence.

If CSB sees a rising edge after power-up, the BMA456 interface switches to SPI until a reset or the next power-up occurs. Therefore, a CSB rising edge is needed before starting the SPI communication. Hence, it is recommended to perform a SPI single read of register <u>CHIP ID</u> (the obtained value will be invalid) before the actual communication start, in order to use the SPI interface.

If toggling of the CSB bit is not possible without data communication, there is in addition the spi\_en bit in Register <u>NV\_CONF</u>, which can be used to permanently set the primary interface to SPI without the need to toggle the CSB pin at every power-up or reset.

#### 6.4. SPI interface and protocol

The timing specification for SPI of the BMA456 is given in the following table:

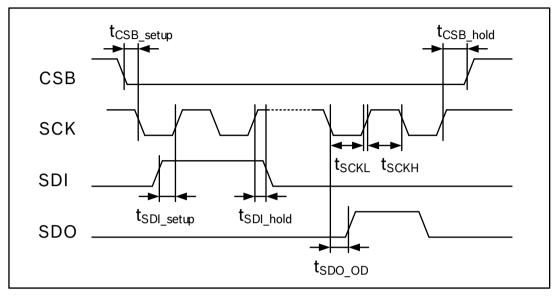

|  | e                          | , tand at $10010 = 1$   |      |     |       |

The following figure shows the definition of the SPI timings:

SPI timing diagram

The SPI interface of the BMA456 is compatible with two modes, '00' [CPOL = '0' and CPHA = '0'] and '11' [CPOL = '1' and CPHA = '1']. The automatic selection between '00' and '11' is controlled based on the value of SCK after a falling edge of CSB.

Two configurations of the SPI interface are supported by the BMA456: 4-wire and 3-wire. The same protocol is used by both configurations. The device operates in 4-wire configuration by default. It can be switched to 3-wire configuration by writing  $\underline{IF}$  CONF.spi3 = 0b1. Pin SDI is used as the common data pin in 3-wire configuration.

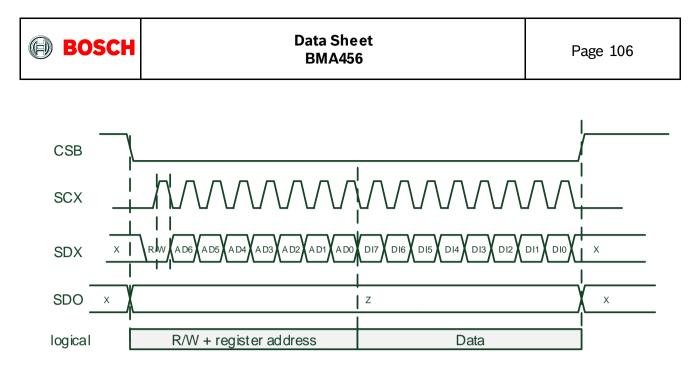

For single byte read as well as write operations, 16-bit protocols are used. The BMA456 also supports multiple-byte read and write operations.

**In SPI 4-wire configuration** CSB (chip select low active), SCK (serial clock), SDI (serial data input), and SDO (serial data output) pins are used. The communication starts when the CSB is pulled low by the SPI master and stops when CSB is pulled high. SCK is also controlled by SPI master. SDI and SDO are driven at the falling edge of SCK and should be captured at the rising edge of SCK.

The basic write operation waveform for 4-wire configuration is depicted in the following figure. During the entire write cycle SDO remains in high-impedance state.

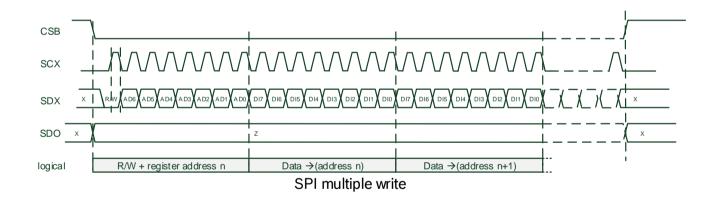

BST-BMA456-DS000-02 | Version 1.2 | April 2019

4-wire basic SPI write sequence (mode '00')

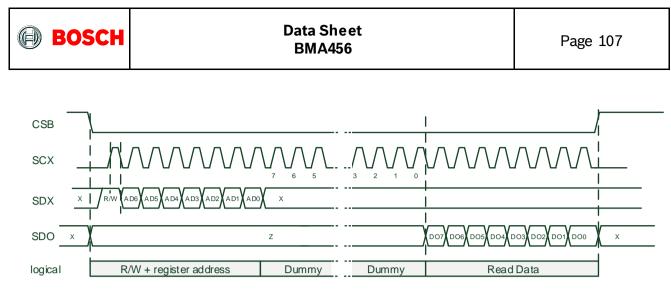

Multiple write operations are possible by keeping CSB low and continuing the data transfer. Only the first register address has to be written. Addresses are automatically incremented after each write access as long as CSB stays active low. The principle of multiple write is shown in figure below:

The basic read operation waveform for 4-wire configuration is depicted in the figure below. Please note that the first byte received from the BMA456 via the SDO line correspond to a dummy byte and the 2<sup>nd</sup> byte correspond to the value read out of the specified register address. That means, for a basic read operation two bytes have to be read and the first has to be dropped and the second byte must be interpreted.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

4-wire basic SPI read sequence (mode '00')

The data bits are used as follows:

R/W: Read/Write bit. When 0, the data SDI is written into the chip. When 1, the data SDO from the chip is read.

AD6-AD0: Address

DI7-DI0: When in write mode, these are the data SDI, which will be written into the address. DO7-DO0: When in read mode, these are the data SDO, which are read from the address.

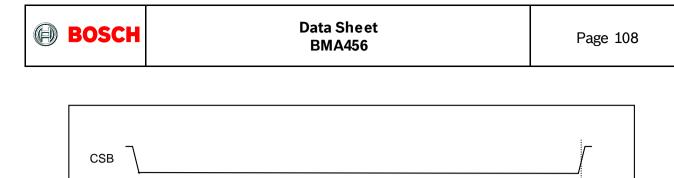

Multiple read operations are possible by keeping CSB low and continuing the data transfer. Only the first register address has to be written. Addresses are automatically incremented after each read access as long as CSB stays active low. Please note that the first byte received from the BMA456 via the SDO line correspond to a dummy byte and the 2<sup>nd</sup> byte correspond to the value read out of the specified register address. The successive bytes read out correspond to values of incremented register addresses. That means, for a multiple read operation of n bytes, n+1 bytes have to be read, the first has to be dropped and the successive bytes must be interpreted.

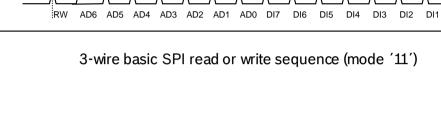

**In SPI 3-wire configuration** CSB (chip select low active), SCK (serial dock), and SDI (serial data input and output) pins are used. While SCK is high, the communication starts when the CSB is pulled low by the SPI master and stops when CSB is pulled high. SCK is also controlled by SPI master. SDI is driven (when used as input of the device) at the falling edge of SCK and should be captured (when used as the output of the device) at the rising edge of SCK.

The protocol as such is the same in 3-wire configuration as it is in 4-wire configuration. The basic operation wave-form (read or write access) for 3-wire configuration is depicted in the figure below:

#### 6.5. Primary I2C Interface

The I<sup>2</sup>C bus uses SCL (= SCx pin, serial clock) and SDA (= SDx pin, serial data input and output) signal lines. Both lines are connected to  $V_{DDIO}$  externally via pull-up resistors so that they are pulled high when the bus is free.

The default I<sup>2</sup>C address of the device is 0b00011000 (0x18). It is used if the SDO pin is pulled to 'GND'. The alternative address 0b00011001 (0x19) is selected by pulling the SDO pin to 'VDDIO'.

The I<sup>2</sup>C interface of the BMA456 is compatible with the I<sup>2</sup>C Specification UM10204 Rev. 03 (19 June 2007), available at http://www.nxp.com. The BMA456 supports I<sup>2</sup>C standard mode and fast mode, only 7-bit address mode is supported. For  $V_{DDIO}$  = 1.2V to 1.62 V the guaranteed voltage output levels are slightly relaxed as described in Table 1 of the electrical specification section.

BMA456 also supports an **extended I<sup>2</sup>C mode** that allows using clock frequencies up to 1 MHz. In this mode all timings of the fast mode apply and it additionally supports clock frequencies up to 1MHz.

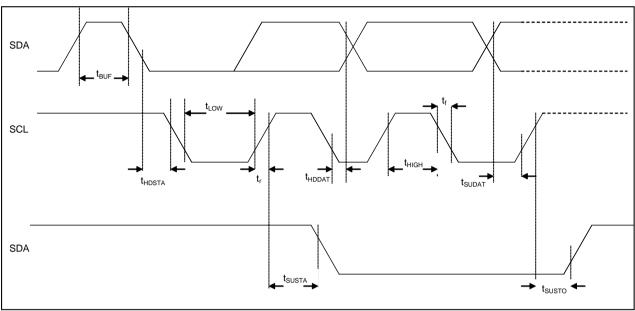

| Parameter  | Symbol                  | Condition         | Min  | Max  | Units |

The timing specification for I<sup>2</sup>C of the BMA456 is given in the following table:

BST-BMA456-DS000-02 | Version 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

The figure below shows the definition of the I<sup>2</sup>C timings given in Table 28:

I<sup>2</sup>C timing diagram

The I<sup>2</sup>C protocol works as follows:

**START**: Data transmission on the bus begins with a high to low transition on the SDA line while SCL is held high (start condition (S) indicated by I<sup>2</sup>C bus master). Once the START signal is transferred by the master, the bus is considered busy.

**STOP**: Each data transfer should be terminated by a Stop signal (P) generated by master. The STOP condition is a low to high transition on SDA line while SCL is held high.

**ACKS**: Each byte of data transferred must be acknowledged. It is indicated by an acknowledge bit sent by the receiver. The transmitter must release the SDA line (no pull down) during the acknowledge pulse while the receiver must then pull the SDA line low so that it remains stable low during the high period of the acknowledge clock cycle.

In the following diagrams these abbreviations are used:

S Start P Stop ACKS Acknowledge by slave ACKM Acknowledge by master NACKM Not acknowledge by master RW Read / Write

A START immediately followed by a STOP (without SCL toggling from 'VDDIO' to 'GND') is not supported. If such a combination occurs, the STOP is not recognized by the device.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

Bosch Sensortec

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

#### I<sup>2</sup>C write access:

I<sup>2</sup>C write access can be used to write a data byte in one sequence.

The sequence begins with start condition generated by the master, followed by 7 bits slave address and a write bit (RW = 0). The slave sends an acknowledge bit (ACKS = 0) and releases the bus. Then the master sends the one byte register address. The slave again acknowledges the transmission and waits for the 8 bits of data which shall be written to the specified register address. After the slave acknowledges the data byte, the master generates a stop signal and terminates the writing protocol.

Example of an I<sup>2</sup>C write access:

| Start | Start Slave Adress |     | < | Register address (0x41) | ACK Re | tegister data (0x01) | ACK Stop |
|-------|--------------------|-----|---|-------------------------|--------|----------------------|----------|
| S     | 0 0 1 1 0 0 0      | 0 0 | x | X 1 0 0 0 0 1           | 0 0 0  | 0 0 0 0 0 1          | 0 P      |

Master -> Slave Slave -> Master

I<sup>2</sup>C write

Multi-byte writes are supported without restriction on normal registers with auto-increment, on special registers with address trap.

#### I<sup>2</sup>C read access:

I<sup>2</sup>C read access also can be used to read one or multiple data bytes in one sequence.

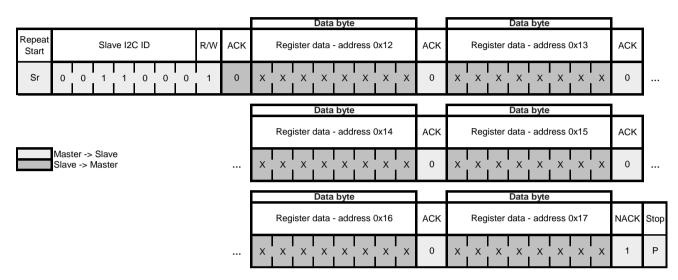

A read sequence consists of a one-byte I<sup>2</sup>C write phase followed by the I<sup>2</sup>C read phase. The two parts of the transmission must be separated by a repeated start condition (S). The I<sup>2</sup>C write phase addresses the slave and sends the register address to be read. After slave acknowledges the transmission, the master generates again a start condition and sends the slave address together with a read bit (RW = 1). Then the master releases the bus and waits for the data bytes to be read out from slave. After each data byte the master has to generate an acknowledge bit (ACKS = 0) to enable further data transfer. A NACKM (ACKS = 1) from the master stops the data being transferred from the slave. The slave releases the bus so that the master can generate a STOP condition and terminate the transmission. The register address is automatically incremented and, therefore, more than one byte can be sequentially read out. Once a new data read transmission starts, the start address will be set to the register address specified since the latest I<sup>2</sup>C write command. By default the start address is set at 0x00. In this way repetitive multi-bytes reads from the same starting address are possible.

BST-BMA456-DS000-02 | Versi on 1.2 | April 2019

<sup>©</sup> Bosch Sensortec GmbH reserves all rights even in the event of industrial property rights. We reserve all rights of disposal such as copying and passing on to third parties. BOSCH and the symbol are registered trademarks of Robert Bosch GmbH, Germany. Note: Specifications within this document are subject to change without notice.

| Start | Slave I2C ID |   |   | R/W | ACK | Register address (0x12) |   |   |   |   | ACK |   |   |   |   |   |   |   |
|-------|--------------|---|---|-----|-----|-------------------------|---|---|---|---|-----|---|---|---|---|---|---|---|
| S     | 0            | 0 | 1 | 1   | 0   | 0                       | 0 | 0 | 0 | х | 0   | 0 | 1 | 0 | 0 | 1 | 0 | 0 |

In order to prevent the I<sup>2</sup>C slave of the device to lock-up the I<sup>2</sup>C bus, a watchdog timer (WDT) is implemented. The WDT observes internal I<sup>2</sup>C signals and resets the I<sup>2</sup>C interface if the bus is locked-up by the BMA456. The activity and the timer period of the WDT can be configured through the bits NV CONF.i2c wdt en and NV CONF.i2c wdt sel.

#### 6.6. SPI and I<sup>2</sup>C Access Restrictions

In order to allow for the correct internal synchronization of data written to the BMA456, certain access restrictions apply for consecutive write accesses or a write/read sequence through the SPI as well as I2C interface. The required waiting period depends on whether the device is operating in normal mode or other modes.

As illustrated in the figure below, an interface idle time of at least 2  $\mu$ s is required following a write operation when the device operates in normal mode. In suspend mode an interface idle time of least 1000  $\mu$ s is required.

Post-Write Access Timing Constraints

### 6.7. Auxiliary Interface

The BMA456 allows attaching an external sensor (MAG-sensor) to a BMA456 via the auxiliary interface. The connection diagrams for the auxiliary interface are depicted in the chapter 7.3. The timings of the secondary I2C interface are the same as for the primary I2C interface, see chapter 6.5.

BM456 acts as a master of the secondary interface, controls the data acquisition of the MAG-sensor (slave of the secondary interface) and presents the data to the application process or (AP) in the user registers of the BMA456 through the primary interface. No external pull-up resistors need to be connected, since an internal pull-up can be configured in the BMA456 (default value: internal pull-up is off, please contact your regional sales representative if you want to use this functionality). No additional I2C master or slave devices must be attached to the magnetometer interfaces.

The BMA456 autonomously reads out the sensor data from BMM150 without intervention of the AP and stores the data in its data registers (per default) and FIFO (see Register <u>FIFO CONFIG 1.fifo aux en</u>). The initial setup of the BMM150 after power-on is done through indirect addressing in the BMA456. From a system perspective the initialization for BMM150 when attached to BMA456 should be possible within 100ms.

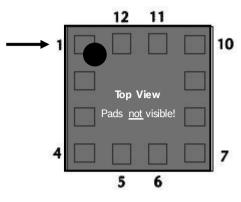

More information about the usage of Auxiliary Interface can be found in chapter 4.8.

## 8. Package

8.1. Package outline dimensions

BST-BMA456-DS000-02 | Version 1.2 | April 2019

Bosch Sensortec

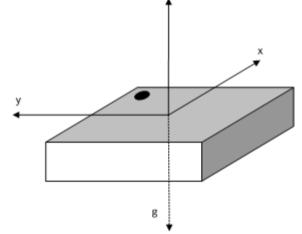

#### 8.2. Sensing axis orientation

If the sensor is accelerated in the indicated directions, the corresponding channel will deliver a positive acceleration signal (dynamic acceleration). If the sensor is at rest and the force of gravity is acting along the indicated directions, the output of the corresponding channel will be negative (static acceleration).

Example: If the sensor is at rest or at uniform motion in a gravity field according to the figure given below, the output signals are:

- ± 0g for the Y channel
- + 1g for the Z channel

The following table lists all corresponding output signals on X, Y, and Z while the sensor is at rest or at uniform motion in a gravity field under assumption of a  $\pm 4$ g range setting, a 16 bit resolution, and a top down gravity vector as shown above.

| Sensor Orientation<br>(gravity vector ↓) | •             |             |             |               | unright     | 1dgirqu       |
|--|---------------|-------------|-------------|---------------|-------------|---------------|
| Output Signal X                          | 0g/0LSB       | 1g/8192 LSB | 0g/0LSB     | -1g/-8292 LSB | 0g/0LSB     | 0g/0LSB       |
| Output Signal Y                          | -1g/-8192 LSB | 0g/0LSB     | 1g/8192 LSB | 0g/0LSB       | 0g/0LSB     | 0g/0LSB       |
| Output Signal Z                          | 0g/0LSB       | 0g/0LSB     | 0g/0LSB     | 0g/0LSB       | 1g/8192 LSB | -1g/-8192 LSB |

#### 8.3. Landing pattern recommendation

The recommended landing pattern for the BMA456 on customer's PCB is given in the following figure. It is recommended to avoid any wiring underneath the BMA456 (shaded area).

#### 8.4. Marking

#### **Mass production**

| Labeling | Name                         | Symbol | Remark   |
|----------|------------------------------|--------|--|
|          | Counter ID                   | ссс    | 3 alphanumeric digits, variable<br>to generate trace-code. |
|          | Pin 1 identifier<br>top side | •      |  |
| CCC      |                              |        |  |

## Engineering samples

| Labeling | Name                         | Symbol | Remark  |
|----------|------------------------------|--------|---|
|          | Eng. sample ID               | E, N   | 2 alphanumeric digits, fixed to identify<br>engineering sample, N = "C" |
|          | Sample ID                    | СС     | 2 alphanumeric digits, variable<br>to generate trace-code.              |
| NCC      | Pin 1 identifier<br>top side | •      |   |
|          |                              |        |   |

BST-BMA456-DS000-02 | Version 1.2 | April 2019

#### 8.5. Soldering guidelines

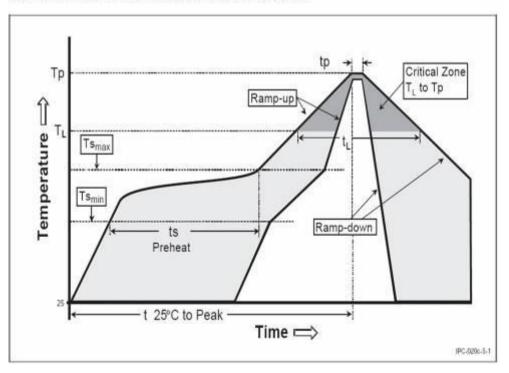

The moisture sensitivity level of the BMA456E sensors corresponds to JEDEC Level 1, see also

- IPC/JEDEC J-STD-020C "Joint Industry Standard: Moisture/Reflow Sensitivity Classification for non-hermetic Solid State Surface Mount Devices"
- IPC/JEDEC J-STD-033A "Joint Industry Standard: Handling, Packing, Shipping and Use of Moisture/Reflow Sensitive Surface Mount Devices"

The sensor fulfils the lead-free soldering requirements of the above-mentioned IPC/JEDEC standard, i.e. reflow soldering with a peak temperature up to 260°C.

| Profile Feature   | Pb-Free Assembly                   |
|---|------------------------------------|
| Average Ramp-Up Rate<br>(Ts <sub>max</sub> to Tp)   | 3° C/second max.                   |
| Preheat<br>– Temperature Min (Ts <sub>min</sub> )<br>– Temperature Max (Ts <sub>max</sub> )<br>– Time (ts <sub>min</sub> to ts <sub>max</sub> ) | 150.°C<br>200.°C<br>60-180 seconds |
| Time maintained above:<br>- Temperature (T <sub>L</sub> )<br>- Time (t <sub>L</sub> )   | 217 °C<br>60-150 seconds           |
| Peak/Classification Temperature (Tp)  | 260 °C                             |
| Time within 5 °C of actual Peak<br>Temperature (tp)   | 20-40 seconds                      |
| Ramp-Down Rate  | 6 *C/second max.                   |
| Time 25 °C to Peak Temperature  | 8 minutes max.                     |

Note 1: All temperatures refer to topside of the package, measured on the package body surface.

BST-BMA456-DS000-02 | Version 1.2 | April 2019

#### 8.6. Handling instructions

Micromechanical sensors are designed to sense acceleration with high accuracy even at low amplitudes and contain highly sensitive structures inside the sensor element. The MEMS sensor can tolerate mechanical shocks up to several thousand g's. However, these limits might be exceeded in conditions with extreme shock loads such as e.g. hammer blow on or next to the sensor, dropping of the sensor onto hard surfaces etc.

We recommend to avoid g-forces beyond the specified limits during transport, handling and mounting of the sensors in a defined and qualified installation process.

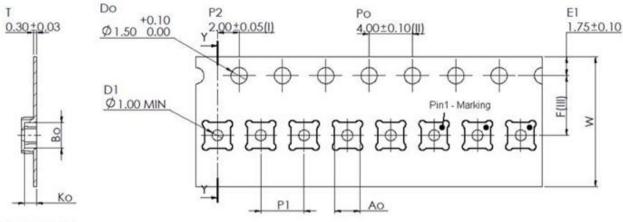

This device has built-in protections against high electrostatic discharges or electric fields (e.g. 2kV HBM); however, anti-static precautions should be taken as for any other CMOS component. Unless otherwise specified, proper operation can only occur when all terminal voltages are kept within the supply voltage range. Unused inputs must always be tied to a defined logic voltage level.

#### 8.8. Environmental safety

The BMA456 sensor meets the requirements of the EC restriction of hazardous substances (RoHS) directive, see also:

Directive 2011/65/EU of the European Parliament and of the Council of 8 September 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment.

#### Halogen content

The BMA456 is halogen-free. For more details on the corresponding analysis results please contact your Bosch Sensortec representative.

#### Internal package structure

Within the scope of Bosch Sensortec's ambition to improve its products and secure the mass product supply, Bosch Sensortec qualifies additional sources (e.g. 2<sup>nd</sup> source) for the LGA package of the BMA456.

While Bosch Sensortec took care that all of the technical packages parameters are described above are 100% identical for all sources, there can be differences in the chemical content and the internal structural between the different package sources.

However, as secured by the extensive product qualification process of Bosch Sensortec, this has no impact to the usage or to the quality of the BMA456 product.

# 9. Legal disclaimer

### 9.1. Engineering samples

Engineering Samples are marked with an asterisk (\*) or (e). Samples may vary from the valid technical specifications of the product series contained in this data sheet. They are therefore not intended or fit for resale to third parties or for use in end products. Their sole purpose is internal client testing. The testing of an engineering sample may in no way replace the testing of a product series. Bosch Sensortec assumes no liability for the use of engineering samples. The Purchaser shall indemnify Bosch Sensortec from all claims arising from the use of engineering samples.

### 9.2. Product use

Bosch Sensortec products are developed for the consumer goods industry. They may only be used within the parameters of this product data sheet. They are not fit for use in life-sustaining or security sensitive systems. Security sensitive systems are those for which a malfunction is expected to lead to bodily harm or significant property damage. In addition, they are not fit for use in products which interact with motor vehicle systems.

The resale and/or use of products are at the purchaser's own risk and his own responsibility. The examination of fitness for the intended use is the sole responsibility of the Purchaser.

The purchaser shall indemnify Bosch Sensortec from all third party claims arising from any product use not covered by the parameters of this product data sheet or not approved by Bosch Sensortec and reimburse Bosch Sensortec for all costs in connection with such claims.

The purchaser must monitor the market for the purchased products, particularly with regard to product safety, and inform Bosch Sensortec without delay of all security relevant incidents.

### 9.3. Application examples and hints

With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Bosch Sensortec hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights or copyrights of any third party. The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. They are provided for illustrative purposes only and no evaluation regarding infringement of intellectual property rights or copyrights or entry of the evaluation of the device of error has been made.
