

NCP336, NCP337

Controlled Load Switch with Auto-Discharge Path, 3 A

Description

The NCP336 and NCP337 are very low R_{on} MOSFET controlled by external logic pin, allowing optimization of battery life, and portable device autonomy.

Indeed, thanks to a current consumption optimization with PMOS structure, leakage currents are eliminated by isolating connected IC on the battery when not used.

Output discharge path is also embedded to eliminate residual voltages on the output rail for the NCP337 part only.

Proposed in a wide input voltage range from 1.2 V to 5.5 V, in a small 1 x 1.5 mm WLCSP6, pitch 0.5 mm.

Features

- 1.2 V – 5.5 V Operating Range
- 21 m Ω P MOSFET at 4.5 V
- DC Current up to 3 A
- Output Auto-Discharge
- Active High EN Pin
- WLCSP6 1 x 1.5 mm
- This Device is Pb-Free, Halogen Free/BFR Free and is RoHS Compliant

Applications

- Mobile Phones
- Tablets
- Digital Cameras
- GPS
- Portable Devices

ORDERING INFORMATION

See detailed ordering and shipping information on page 8 of this data sheet.

Figure 1. Typical Application Circuit

NCP336, NCP337

Table 1. PIN FUNCTION DESCRIPTION

Pin Name	Pin Number	Type	Description
IN	A2, B2	POWER	Load-switch input voltage; connect a 1 μ F or greater ceramic capacitor from IN to GND as close as possible to the IC.
GND	C1	POWER	Ground connection.
EN	C2	INPUT	Enable input, logic high turns on power switch.
OUT	A1, B1	OUTPUT	Load-switch output; connect a 1 μ F ceramic capacitor from OUT to GND as close as possible to the IC is recommended.

Figure 2. Block Diagram

NCP336, NCP337

Table 2. MAXIMUM RATINGS

Rating	Symbol	Value	Unit
IN, OUT, EN, Pins: (Note 1)	V_{EN}, V_{IN}, V_{OUT}	-0.3 to + 7.0	V
From IN to OUT Pins: Input/Output (Note 1)	V_{IN}, V_{OUT}	0 to + 7.0	V
Maximum Junction Temperature	T_J	-40 to + 125	°C
Storage Temperature Range	T_{STG}	-40 to + 150	°C
Moisture Sensitivity (Note 2)	MSL	Level 1	

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Table 3. OPERATING CONDITIONS

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IN}	Operational Power Supply		1.2		5.5	V
V_{EN}	Enable Voltage		0		5.5	
T_A	Ambient Temperature Range		-40	25	+85	°C
T_J	Junction Temperature Range		-40	25	+125	°C
C_{IN}	Decoupling input capacitor		1			μF
C_{OUT}	Decoupling output capacitor		1			μF
$R_{\theta JA}$	Thermal Resistance Junction to Air	WLCSP package (Note 3)		100		°C/W
I_{OUT}	Maximum DC current				3	A
P_D	Power Dissipation Rating (Note 4)	$T_A \leq 25^\circ\text{C}$ WLCSP package		0.66		W
		$T_A = 85^\circ\text{C}$ WLCSP package		0.26		W

1. According to JEDEC standard JESD22-A108.
2. Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020.
3. The $R_{\theta JA}$ is dependent of the PCB heat dissipation and thermal via.
4. The maximum power dissipation (P_D) is given by the following formula:

$$P_D = \frac{T_{JMAX} - T_A}{R_{\theta JA}}$$

NCP336, NCP337

Table 4. ELECTRICAL CHARACTERISTIC Min & Max Limits apply for T_A between -40°C to $+85^{\circ}\text{C}$ for V_{IN} between 1.2 V to 5.5 V (Unless otherwise noted). Typical values are referenced to $T_A = +25^{\circ}\text{C}$ and $V_{IN} = 5\text{ V}$ (Unless otherwise noted).

Symbol	Parameter	Conditions		Min	Typ	Max	Unit

FUNCTIONAL DESCRIPTION

Overview

The NCP337 is a high side P channel MOSFET power distribution switch designed to isolate ICs connected on the battery in order to save energy. The part can be turned on, with a wide range of battery from 1.2 V to 5.5 V.

Enable Input

Enable pin is an active high. The path is opened when EN pin is tied low (disable), forcing P MOS switch off.

The IN/OUT path is activated with a minimum of V_{in} of 1.2 V and EN forced to high level.

Auto Discharge

NMOS FET is placed between the output pin and GND, in order to discharge the application capacitor connected on OUT pin.

The auto-discharge is activated when EN pin is set to low level (disable state).

The discharge path (Pull down NMOS) stays activated as long as EN pin is set at low level and $V_{in} > 1.2$ V.

In order to limit the current across the internal discharge Nmosfet, the typical value is set at 70 Ω .

Cin and Cout Capacitors

IN and OUT, 1 μ F, at least, capacitors must be placed as close as possible the part to for stability improvement.

APPLICATION INFORMATION

Power Dissipation

Main contributor in term of junction temperature is the power dissipation of the power MOSFET. Assuming this, the power dissipation and the junction temperature in normal mode can be calculated with the following equations:

- $P_D = R_{DS(on)} \times (I_{OUT})^2$
 P_D = Power dissipation (W)
 $R_{DS(on)}$ = Power MOSFET on resistance (Ω)
 I_{OUT} = Output current (A)

- $T_J = P_D \times R_{\theta JA} + T_A$
 T_J = Junction temperature ($^{\circ}\text{C}$)
 $R_{\theta JA}$ = Package thermal resistance ($^{\circ}\text{C}/\text{W}$)
 T_A = Ambient temperature ($^{\circ}\text{C}$)

PCB Recommendations

The NCP337 integrates an up to 3 A rated PMOS FET, and the PCB design rules must be respected to properly evacuate the heat out of the silicon. By increasing PCB area, especially around IN and OUT pins, the $R_{\theta JA}$ of the package can be decreased, allowing higher power dissipation.

Figure 14. Routing Example: 2 oz, 4 layers with vias across 2 internal inners.

Example of application definition.

$$T_J - T_A = R_{\theta JA} \times P_D = R_{\theta JA} \times R_{DS(on)} \times I^2$$

T_J : junction temperature.

T_A : ambient temperature.

R_{θ} = Thermal resistance between IC and air, through PCB.

$R_{DS(on)}$: intrinsic resistance of the IC Mosfet.

I : load DC current.

Taking into account of R_{θ} obtain with:

- 1 oz, 2 layers: 100 $^{\circ}\text{C}/\text{W}$.

At 3 A, 25 $^{\circ}\text{C}$ ambient temperature, $R_{DS(on)}$ 20 m Ω @ Vin 5 V, the junction temperature will be:

$$T_J = T_A + R_{\theta} \times P_D = 25 + (0.024 \times 3^2) \times 100 = 43^{\circ}\text{C}$$

Taking into account of R_{θ} obtain with:

- 2 oz, 4 layers: 60 $^{\circ}\text{C}/\text{W}$.

At 3 A, 65 $^{\circ}\text{C}$ ambient temperature, $R_{DS(on)}$ 24 m Ω @ Vin 5 V, the junction temperature will be:

$$T_J = T_A + R_{\theta} \times P_D = 65 + (0.024 \times 3^2) \times 60 = 78^{\circ}\text{C}$$
