16-BIT, HIGH-SPEED, LOW-NOISE, VOLTAGE OUTPUT DIGITAL-TO-ANALOG CONVERTER

Check for Samples: DAC8581

FEATURES

- **16-Bit Monotonic**
- **±5-V Bipolar Output**
- **Very Low Glitch: 0.5 nV-s**
- **Fast Settling: 0.65 µs**
- **Fast Slew Rate: 35 V/µs**
- **Low Noise: 20 nV/$\sqrt{Hz}$**
- **±25-mA Load Drive**
- **±5-V Dual Power Supply**
- **Single External Reference**
- **Power-On Reset to Midscale**
- **3-MSPS Update Rate**
- **SPI™ Interface, Up to 50 MHz**
- **1.8-V–5-V Logic Compatible**
- **Twos Complement Data Format**
- **Hardware Reset to Midscale**
- **TSSOP-16 Package**

APPLICATIONS

- **Industrial Process Control**
- **CRT Projection TV Digital Convergence**
- **Waveform Generation**
- **Automated Test Equipment**
- **Ultrasound**

DESCRIPTION

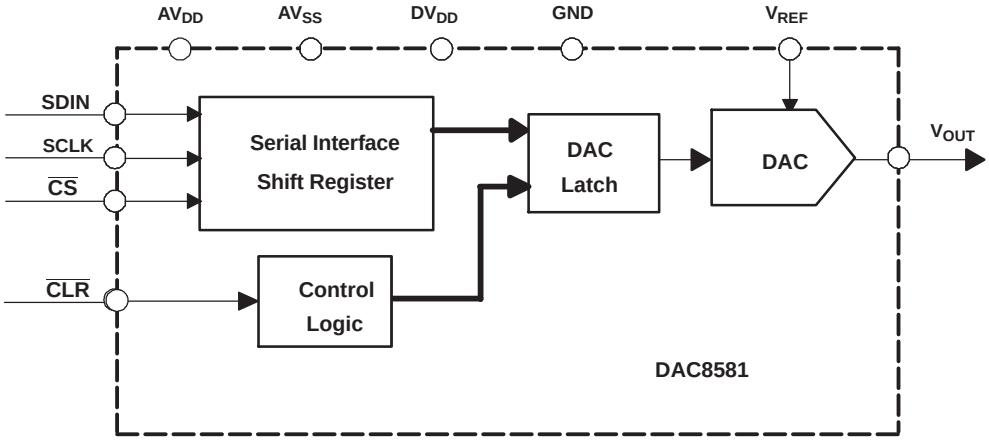
The DAC8581 is a 16-bit, high-speed, low-noise DAC operating from dual ±5-V power supplies. The DAC8581 is monotonic, and has exceptionally low noise and exceptionally low glitch. The DAC8581 high-performance, bipolar output buffer is capable of settling within 0.65 µs for a 10-V step. Small-signal settling time is well under 0.3 µs, supporting data update rates up to 3 MSPS. A power-on-reset circuit sets the output at midscale voltage on power up.

The DAC8581 is simple to use, with a single external reference and a standard 3-wire SPI interface that allows clock rates up to 50 MHz.

Also see the DAC8580, a member of the same family. The DAC8580 combines DAC8581 performance with an on-chip, 16x over-sampling digital filter.

The DAC8581 is specified over the –40°C to +85°C temperature range.

FUNCTIONAL BLOCK DIAGRAM OF DAC8581



This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION(1)

PRODUCT	PACKAGE	PACKAGE DRAWING NUMBER	SPECIFICATION TEMPERATURE RANGE	PACKAGE ORDERING MARKING	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
DAC8581	TSSOP-16	PW	–40°C to +85°C	D8581I	DAC8581IPW	Tube, 90-Piece
					DAC8581IPWR	Tape and Reel, 2000-Piece

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS(1)

		UNIT
AV_{DD} or DV_{DD} to AV_{SS}		–0.3 V to 12 V
Digital input voltage to AV_{SS}		–0.3 V to 12 V
V_{OUT} or V_{REF} to AV_{SS}		–0.3 V to 12 V
DGND and AGND to AV_{SS}		–0.3 V to 6 V
Operating temperature range		–40°C to +85°C
Storage temperature range		–65°C to +150°C
Junction temperature range (T_J max)		+150°C
Power dissipation	Thermal impedance (θ_{JA})	118°C/W
	Thermal impedance (θ_{JC})	29°C/W

(1) Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

All specifications at $T_A = T_{MIN}$ to T_{MAX}, $+AV_{DD} = +5$ V, $-AV_{DD} = -5$ V, $DV_{DD} = +5$ V (unless otherwise noted).

PARAMETER	TEST CONDITIONS	DAC8581			UNIT
		MIN	TYP	MAX	
STATIC PERFORMANCE					
Resolution		16			Bits
Linearity error	V_{REF} = 4.096 V		±0.03	±0.1	%FS
Differential linearity error			±0.25	±0.5	LSB
Gain error		1	2	3	%FS
Gain drift			±5		ppm/°C
Bipolar zero error			–5	±25	mV
Bipolar zero drift			±20		µV/°C
Total drift			±10		ppm/°C
OUTPUT CHARACTERISTICS					
Voltage output	V_{REF} up to 5.5 V, when AV_{DD} = 6 V, AV_{SS} = –6 V	$-V_{REF}$		V_{REF}	V
Output impedance			1		Ω
Maximum output current			±25		mA
Settling time	C_L < 200 pF, R_L = 2 kΩ, to 0.1% FS, 8-V step		0.65		µs
	To 0.003% FS		1		
Slew rate(1)			35		V/µs
Code change glitch	1 LSB change around major carry		0.5		nV-S
Overshoot	Full-scale change		50		mV
Digital feedthrough(2)			0.5		nV-S
SNR	Digital sine wave input, f_{OUT} = 1 kHz, BW = 10 kHz, 2-MSPS update rate		108		dB
THD	Digital sine wave input, f_{OUT} = 20 kHz, 8-V_{PP} output, 2-MSPS update rate		–72		dB
Output voltage noise	0.1 Hz to 10 Hz		25		μV_{PP}
	At 10-kHz offset frequency		25		$nV/\sqrt{Hz}$
	At 100-kHz offset frequency		20		$nV/\sqrt{Hz}$
Power supply rejection	VDD varies ±10%		0.75		mV/V
REFERENCE					
Reference input bandwidth	Large signal: 2-V_{PP} sine wave on 4 V DC		3		MHz
	Small signal: 100-mV_{PP} sine wave on 4 V DC		10		MHz
Reference input voltage range		3		AV_{DD}	V
Reference input impedance			5		kΩ
Reference input capacitance			5		pF
DIGITAL INPUTS					
V_{IH}				0.7 x DV_{DD}	V
V_{IL}		GND		0.3 x DV_{DD}	
Input current				±1	µA
Input capacitance				10	pF
Power-on delay	From V_{DD} high to $\overline{CS}$ low		20		µs

(1) Slew rate is measured from 10% to 90% of transition when the output changes from 0 to full-scale.
(2) Digital feedthrough is defined as the impulse injected into the analog output from the digital input. It is measured when the DAC output does not change, $\overline{CS}$ is held high, and while SCLK and SDIN signals are toggled.

ELECTRICAL CHARACTERISTICS (continued)

All specifications at $T_A = T_{MIN}$ to T_{MAX}, $+AV_{DD}$ = +5 V, $-AV_{DD}$ = –5 V, DV_{DD} = +5 V (unless otherwise noted).

PARAMETER	TEST CONDITIONS	DAC8581			UNIT
		MIN	TYP	MAX

TERMINAL FUNCTIONS

TERMINAL		
NAME	**NO.**	
V_{REF}	1	Reference input voltage.
VOUT	2	DAC output voltage. Output swing is $\pm V_{REF}$
AV_{SS}	3	Negative analog supply voltage, tie to –5 V
AV_{DD}	4	Positive analog supply voltage, tie to +5 V
AGND	5	The ground reference point of all analog circuitry of the device. Tie to 0 V.
DGND	6, 7, 8, 15	Tie to DGND to ensure correct operation.
SDIN	9	Digital input, serial data. Ignored when $\overline{CS}$ is high.
SCLK	10	Digital input, serial bit clock. Ignored when $\overline{CS}$ is high.
$\overline{CS}$	11	Digital input. Chip Select ($\overline{CS}$) signal. Active low. When $\overline{CS}$ is high, SCLK and SDI are ignored. When $\overline{CS}$ is low, data can be transferred into the device.
DGND	12	Ground reference for digital circuitry. Tie to 0 V.
DV_{DD}	13	Positive digital supply, 1.8 V–5.5 V compatible
$\overline{CLR}$	14	Digital input for forcing the output to midscale. Active low. When pin $\overline{CLR}$ is low during 16th SCLK following the falling edge of $\overline{CS}$, the falling edge of 16th SCLK sets DAC Latch to midcode, and the DAC output to 0 V. When pin $\overline{CLR}$ is High, the falling edge of 16th SCLK updates DAC latch with the value of input shift register, and changes DAC output to corresponding level.
DV_{DD}	16	Tie to DV_{DD} to ensure correct operation.

TIMING REQUIREMENTS(1)

PARAMETER		MIN	MAX	UNIT
t_{SCK}	SCLK period	20		ns
t_{WSCK}	SCLK high or low time	10		ns
t_{Lead}	Delay from falling $\overline{CS}$ to first rising SCLK	20		ns
t_{TD}	$\overline{CS}$ High between two active Periods	20		ns
t_{SU}	Data setup time (Input)	5		ns
t_{H}I	Data hold time (input)	5		ns
t_R	Rise time		30	ns
t_F	Fall time		30	ns
t_{WAIT}	Delay from 16th falling edge of SCLK to $\overline{CS}$ low	100		ns
t_{UPDAC}	Delay from 16th falling edge of SCLK to DAC output	1		µs
	V_{DD} High to $\overline{CS}$ Low (power-up delay)	100		µs

(1) Assured by design. Not production tested.

THEORY OF OPERATION

The DAC8581 uses a proprietary, monotonic, high-speed resistor string architecture. The 16-bit input data are coded in twos complement, MSB-first format and transmitted using a 3-wire serial interface. The serial interface sends the input data to the DAC latch. The digital data are then decoded to select a tap voltage of the resistor string. The resistor string output is sent to a high-performance output amplifier. The output buffer has bipolar (±5 V) swing capability on a 600-Ω, 200-pF load. The resistor string DAC architecture provides exceptional differential linearity and temperature stability whereas the output buffer provides fast-settling, low-glitch, and exceptionally low idle-channel noise. The DAC8581 settles within 1 µs for large input signals. Exceptionally low glitch (0.5 nV-s) is attainable for small-signal, code-to-code output changes. The resistor string architecture also provides code-independent power consumption and code-independent settling time. The DAC8581 resistor string needs an external reference voltage to set the output voltage range of the DAC. To aid fast settling, V_{REF} input is internally buffered.

Supply Pins

The DAC8581 uses ±5-V analog power supplies (AV_{DD}, AV_{SS}) and a 1.8-V to 5.5-V digital supply (DV_{DD}). Analog and digital ground pins (AGND and DGND) are also provided. For low-noise operation, analog and digital power and ground pins should be separated. Sufficient bypass capacitors, at least 1 µF, should be placed between AV_{DD} and AV_{SS}, AV_{SS} and DGND, and DV_{DD} and DGND pins. Series inductors are *not* recommended on the supply paths. The digital input pins should not exceed the ground potential during power up. During power up, AGND and DGND are first applied with all digital inputs and the reference input kept at 0 V. Then, AV_{DD}, DV_{DD}, AV_{SS}, and V_{REF} should be applied together. Care should be taken to avoid applying V_{REF} before AV_{DD} and AV_{SS}. All digital pins must be kept at ground potential before power up.

Reference Input Voltage

The reference input pin V_{REF} is typically tied to a +3.3-V, +4.096-V, or +5.0-V external reference. A bypass capacitor (0.1 µF or less) is recommended, depending on the load-driving capability of the voltage reference. To reduce crosstalk and improve settling time, the V_{REF} pin is internally buffered by a high-performance amplifier. The V_{REF} pin has constant 5-kΩ impedance to AGND. The output range of the DAC8581 is equal to $\pm V_{REF}$ voltage. The V_{REF} pin should be powered at the same time, or after the supply pins. REF3133 and REF3140 are recommended to set the DAC8581 output range to ±3.3 V and ±4.096 V, respectively.

Output Voltage

The input data format is in twos-complement format as shown in Table 1. The DAC8581 uses a high-performance, bipolar output buffer capable of driving a 600-Ω, 200-pF load with fast 0.65-µs settling. The buffer has exceptional noise performance (20 nV/$\sqrt{Hz}$) and fast slew rate (35 V/µs). The small-signal settling time is under 300 ns, allowing update rates up to 3 MSPS. Loads of 50 Ω or 75 Ω could be driven as long as output current does not exceed ±25 mA continuously. Long cables, up to 1 nF in capacitance, can be driven without the use of external buffers. To aid stability under large capacitive loads (>1 nF), a small series resistor can be used at the output.

Table 1. Data Format

DAC OUTPUT	DIGITAL CODE	
	BINARY	HEX
$+V_{REF}$	0111111111111111	7FFF
$+V_{REF}/2$	0100000000000000	4000
0	0000000000000000	0000
$-V_{REF}/2$	1011111111111111	BFFF
$-V_{REF}$	1000000000000000	8000

Glitch area is low at 0.5 nV-s, with peak glitch amplitude under 10 mV, and the glitch duration under 100 ns. Low glitch is obtained for code-to-code (small signal) changes across the entire transfer function of the device. For large signals, settling characteristics of the reference and output amplifiers are observed in terms of overshoot and undershoot.

Combined with ±5-V output range, and extremely good noise performance, the outstanding differential linearity performance of this device becomes significant. That is, each DAC step can be clearly observed at the DAC output, without being corrupted by wideband noise.

SERIAL INTERFACE

The DAC8581 serial interface consists of the serial data input pin SDIN, bit clock pin SCLK, and chip-select pin, $\overline{CS}$. The serial interface is designed to support the industry standard SPI interface up to 50 MHz. The serial inputs are 1.8-V to 5.5-V logic compatible.

$\overline{CS}$ operates as an active-low, chip-select signal. The falling edge of $\overline{CS}$ initiates the data transfer. Each rising edge of SCLK following the falling edge of $\overline{CS}$ shifts the SDIN data into a 16-bit shift register, MSB-first. At the 16th rising edge of SCLK, the shift register becomes full and the DAC data updates on the falling edge that follows the 16th rising edge. After the data update, further clocking gets ignored. The sequence restarts at the next falling edge of $\overline{CS}$. If the $\overline{CS}$ is brought high before the DAC data are updated, the data are ignored. See the timing diagram (Figure 1) for details.

Pin $\overline{CLR}$

Pin $\overline{CLR}$ is implemented to set the DAC output to 0 V. When the $\overline{CS}$ pin is low during the 16th SCLK cycle following the falling edge of $\overline{CS}$, the falling edge of the 16th SCLK sets the DAC latch to midcode, and the DAC output to 0 V. If the $\overline{CLR}$ pin is high during the 16th clock, the falling edge of the 16th clock updates the DAC latch with the input data. Therefore, if the $\overline{CLR}$ pin is brought back to High from Low during serial communication, the DAC output stays at 0 V until the falling edge of the next 16th clock is received. The $\overline{CLR}$ pin is active low. $\overline{CLR}$ low does not affect the serial data transfer. The serial data input doe not get interrupted or lost while the output is set at midscale.

SCLK

This digital input pin is the serial bit-clock. Data are clocked into the device at the rising edge of SCLK.

$\overline{CS}$

This digital input pin is the chip-select signal. When $\overline{CS}$ is low, the serial port is enabled and data can be transferred into the device. When $\overline{CS}$ is high, all SCLK and SDIN signals are ignored.

SDIN

This digital input is the serial data input. Serial data are shifted on the rising edge of the SCLK when $\overline{CS}$ is low.

APPLICATION INFORMATION

IMPROVING DAC8581 LINEARITY USING EXTERNAL CALIBRATION

At output frequencies up to 50 kHz, DAC8581 linearity error and total harmonic distortion are dominated by resistor mismatches in the string. These resistor mismatches are fairly insensitive to temperature and aging effects and also to reference voltage changes. Therefore, it is possible to use a piece-wise linear (PWL) approximation to cancel linearity errors, and the calibration remains effective for different supply and V_{REF} voltages, etc. The cancellation of linearity errors also improves the total harmonic distortion (THD) performance. It is possible to improve the integral linearity errors from ±25 LSB to ±1 LSB and the THD from –70 dB to almost –98 dB (see Figure 17 and Figure 18). The improvements are at the expense of ~2x DNL deterioration, which is not critical for the generation of large-signal waveforms.

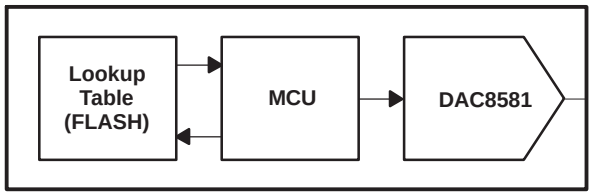

Figure 19. A Simple Printed-Circuit Board Scheme for Calibrated Use of DAC8581

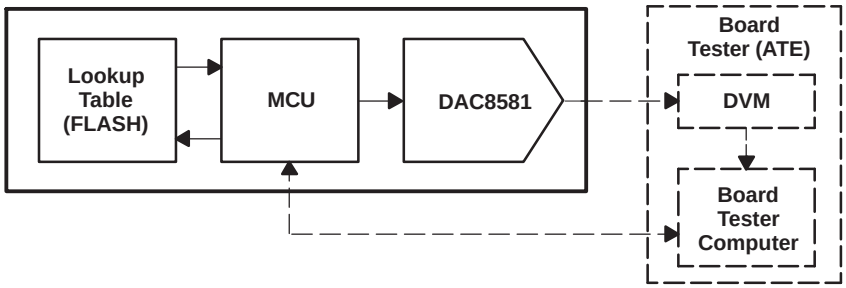

Figure 20. Production Test Setup for a DAC8581 Board With Calibration

The PWL calibration scheme uses a DAC8581 and a microcontroller unit (MCU) with flash memory, on a printed-circuit board as seen in Figure 19. Calibration is done during board test, and the calibration coefficients are stored permanently in flash memory as seen in Figure 20. An automated board tester is assumed to have a precision digital voltmeter (DVM) and a tester computer. The test flow for a 1024-segment, piece-wise linear calibration is as follows:

1. Use the tester computer to load software into the MCU to ramp the DAC8581 and:
   - Take a reading at each step after a short wait time
   - Store 65,536 readings in the tester computer volatile memory
2. Use the tester computer to:
   - Search the 65,536-point capture data and find the actual DAC8581 codes which would generate ideal DAC outputs for DAC input codes 0, 64, 128, 192, … .
   - Store these actual codes in the onboard microcontroller's flash memory in a 1025-point array called COEFF[].
3. Use the tester computer to program the MCU such that, when the end-user provides new 16-bit input data D0 to the MCU:
   - The 10 MSBs of D0 directly index the array COEFF[].
   - The content of indexed memory of COEFF[] and the content of the next higher memory location are placed in variables I1 and I2.
   - The six LSBs of the user data D0 with two variables I1 and I2 are used for computing Equation 1 (see Figure 21).
   - Instead of D0, I0 is loaded to DAC8581

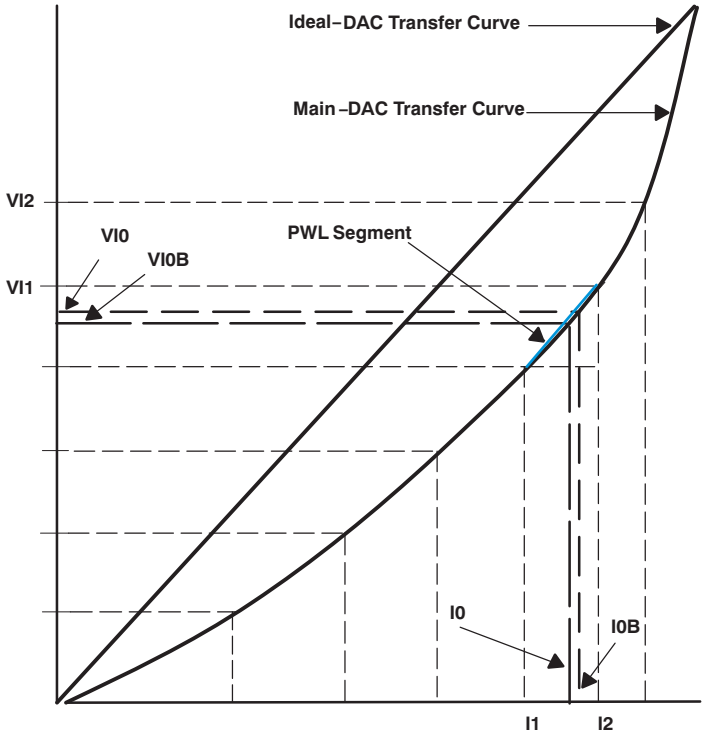

Figure 21. The Geometry Behind the PWL Calibration

$$I0 = \frac{I1 + (I2 - I1)(D0 - VI1)}{VI2 - VI1} \quad (1)$$

Where both x-axis and y-axis are normalized from 0 to 65535, and:

VI0: Desired ideal DAC voltage corresponding to input code D0.

VI0B: DAC8581 output voltage, which approximates VI0 after PWL calibration. This is the actual DAC8581 output for input code D0 after PWL calibration.

I0: DAC8581 code generating VI0B, an approximation to the desired voltage VI0. This is actual code loaded into DAC latch for input code D0, after PWL calibration.

I0B: DAC8581 code, which generates output VI0. This code is approximated by the N-segment PWL calibration.

I1: Contents of memory COEFF[], addressed by the 10 MSBs of user input code D0.

I2: Contents of the next memory location in COEFF[].

VI1: DAC8581 output voltage corresponding to code I1. Notice that (D0–VI1) is nothing but the six LSBs of the input code D0, given that the y-axis is normalized from 0 to 65,536.

VI2: DAC8581 output voltage corresponding to code I2. Notice that (VI2–VI1) is always equal to number 64, given that the y-axis is normalized from 0 to 65,536. Division becomes a 6-bit arithmetic right shift.

Other similar PWL calibration implementations exist. This particular algorithm does not need digital division, and it does not accumulate measurement errors at each segment.

REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (August, 2005) to Revision B	Page
• Updated document format to current stylistic standards	1
• Deleted lead temperature specifications from *Absolute Maximum Ratings* table	2
• Deleted footnote 1 from *Electrical Characteristics* table	3
• Revised test conditions for voltage output specification	3

Changes from Revision B (December 2009) to Revision C	Page
• Changed "rail-to-rail" to "bipolar"	1
• Changed "rail-to-rail" to "bipolar"	9

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC8581IPW	NRND	TSSOP	PW	16	90	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	D8581I	
DAC8581IPWR	NRND	TSSOP	PW	16	2000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	D8581I	

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
