

NCP81246

Three-Rail Controller with Intel Proprietary Interface for IMVP8 CPU Applications

The NCP81246 contains a two-phase, and two single-phase buck regulators optimized for Intel IMVP8 compatible CPUs.

The two-phase controller combines true differential voltage sensing, differential inductor DCR current sensing, input voltage feed-forward, and adaptive voltage positioning to provide accurately regulated power for IMVP8 Rail2.

The two single-phase controllers can be used for Rail1, Rail3 and Rail4 rails. Both make use of ON Semiconductor's patented enhanced RPM operation. RPM control maximizes transient response while allowing for smooth transitions between discontinuous frequency scaling operation and continuous mode full power operation. The single-phase rails have an ultralow offset current monitor amplifier with programmable offset compensation for ultra high accuracy current monitoring.

The NCP81246 offers three internal MOSFET drivers with a single external PWM signal.

Two-Phase Rail Features

- Dual Edge Modulation for Fastest Initial Response to Transient Loading
- High Performance Operational Error Amplifier
- Digital Soft Start Ramp
- Dynamic Reference Injection® (Patent #US7057381)
- Accurate Total Summing Current Amplifier (Patent #US6683441)
- Dual High Impedance Differential Voltage and Total Current Sense Amplifiers
- Phase-to-Phase Dynamic Current Balancing
- True Differential Current Balancing Sense Amplifiers for Each Phase
- Adaptive Voltage Positioning (AVP)
- Switching Frequency Range of 300 kHz – 750 kHz
- Vin range 4.5 V to 25 V
- Start-Up into Pre-Charged Loads While Avoiding False OVP
- UltraSonic Operation
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Single-Phase Rail Features

- Enhanced RPM Control System
- Ultra Low Offset IOUT Monitor
- Dynamic VID Feed-Forward
- Programmable Droop Gain
- Zero Droop Capable
- Thermal Monitor
- UltraSonic Operation
- Adjustable Vboot
- Digitally Controlled Operating Frequency

Table 1. NCP81246 PIN DESCRIPTIONS

| Pin No. | Symbol | Description |
|---------|----------------------------|--|
| 1 | IOUT_2ph | A resistor to ground programs IOUT gain for the two-phase regulator. |
| 2 | DIFFOUT_2ph/ ICCMAX_2ph | Output of the two-phase regulator's differential remote sense amplifier. During start-up, the two-phase regulator's ICCMAX is programmed with a pull-down on this pin. |
| 3 | FB_2ph | Error amplifier voltage feedback for two-phase regulator. |
| 4 | COMP_2ph | Output of the error amplifier and the inverting inputs of the PWM comparators for two-phase regulator. |
| 5 | ILIM_2ph | Over-current threshold setting – programmed with a resistor to CSCOMP_2ph for two-phase regulator. |
| 6 | CSCOMP_2ph | Output of total-current-sense amplifier for two-phase regulator. |
| 7 | CSSUM_2ph | Inverting input of total-current-sense amplifier for two-phase regulator. |
| 8 | CSREF_2ph | Total-current-sense amplifier reference voltage input for two-phase regulator. |
| 9 | CSP2_2ph | Non-inverting input to current-balance amplifier for Phase 2 of the two-phase regulator. |
| 10 | CSP1_2ph | Non-inverting input to current-balance amplifier for Phase 1 of the two-phase regulator. |
| 11 | TSENSE_2ph | Temperature sense input for the two-phase regulator. |
| 12 | VRMP | Feed-forward input of Vin for the ramp-slope compensation. The current fed into this pin is used to control the ramp of the PWM slopes. |
| 13 | VCC | Power for the internal control circuits. A decoupling capacitor is connected from this pin to ground. |
| 14 | BST1 | High-side bootstrap supply for Phase 1 of the two-phase regulator. |
| 15 | HG1 | High-side FET gate driver output for Phase 1 of the two-phase regulator. |

NCP81246

Table 1. NCP81246 PIN DESCRIPTIONS (continued)

| Pin No. | Symbol | Description |
|---------|--------------------|---|
| 16 | SW1 | Current return for high-side FET gate driver for Phase 1 of the two-phase regulator. |
| 17 | LG1/ROSC | Low-side FET gate driver output for Phase 1 of the two-phase regulator. During start-up ROSC is programmed with a pull-down resistor on this line. |
| 18 | PVCC | Power supply for all three internal FET gate drivers. |
| 19 | LG2/ICCMAX_1a | Low-side FET gate driver output for Phase 2 of the two-phase regulator, or output of single-phase regulator 1b. During start-up, regulator 1a's ICCMAX is programmed with a pull-down on this pin. |
| 20 | SW2 | Current return for high-side FET gate driver for Phase 2 of the two-phase regulator, or for single-phase regulator 1b. |
| 21 | HG2 | High-side FET gate driver output for Phase 2 of the two-phase regulator, or for single-phase regulator 1b. |
| 22 | BST2 | High-side bootstrap supply for Phase 2 of the two-phase regulator, or for single-phase regulator 1b. |
| 23 | LG3/ICCMAX_1b | Low-side FET gate driver output for single-phase regulator 1a. During start-up, regulator 1b's ICCMAX is programmed with a pull-down on this pin. |
| 24 | SW3 | Current return for high-side FET gate driver for single-phase regulator 1a. |
| 25 | HG3 | High-side FET gate driver output for single-phase regulator 1a. |
| 26 | BST3 | High-side bootstrap supply for single-phase regulator 1a. |
| 27 | TSENSE_1a | Temperature sense input for the single-phase regulators. |
| 28 | VSP_1a | Differential Output Voltage Sense Positive for single-phase regulator 1a. |
| 29 | VSN_1a | Differential Output Voltage Sense Negative for single-phase regulator 1a. |
| 30 | COMP_1a | Compensation for single-phase regulator 1a. |
| 31 | ILIM_1a | A resistor to ground programs the current-limit for single-phase regulator 1a. |
| 32 | CSN_1a | Differential current sense negative for single-phase regulator 1a. |
| 33 | CSP_1a | Differential current sense positive for single-phase regulator 1a. |
| 34 | IOUT_1a | A resistor to ground programs IOUT gain for single-phase regulator 1a. |
| 35 | VR_HOT# | Thermal logic output for over temperature. |
| 36 | SDIO | Serial VID data interface |
| 37 | ALERT# | Serial VID ALERT# |
| 38 | SCLK | Serial VID clock |
| 39 | DRON | Bi-directional FET driver enable |
| 40 | PWM/ ADDR_VBOOT | PWM output for phase 2 of the two-phase regulator or single-phase regulator 1b. During start-up, a resistor to ground programs Intel proprietary interface address and VBOOT options for all three rails. |
| 41 | EN | Enable. High enables all three rails. |
| 42 | VR_RDY | VR_RDY indicates all three rails are ready to accept Intel proprietary interface commands. |
| 43 | IOUT_1b | A resistor to ground programs IOUT gain for single-phase regulator 1b. |
| 44 | CSP_1b | Differential current sense positive for single-phase regulator 1b. |
| 45 | CSN_1b | Differential current sense negative for single-phase regulator 1b. |
| 46 | ILIM_1b | A resistor to ground programs the current-limit for single-phase regulator 1b. |
| 47 | COMP_1b | Compensation for single-phase regulator 1b. |
| 48 | VSN_1b | Differential Output Voltage Sense Negative for single-phase regulator 1b. |
| 49 | VSP_1b | Differential Output Voltage Sense Positive for single-phase regulator 1b. |
| 50 | PSYS/TSENSE_1b | System power signal input. Resistor to ground for scaling / Temperature sense input for the single-phase regulators. |
| 51 | VSP_2ph | Differential Output Voltage Sense Positive for the two-phase regulator. |
| 52 | VSN_2ph | Differential Output Voltage Sense Negative for the two-phase regulator. |

NCP81246

Table 2. ABSOLUTE MAXIMUM RATINGS

| Pin Symbol | V _{MAX} | V _{MIN} | I _{SOURCE} | I _{SINK} |
|-----------------------------|--|---|---------------------|-------------------|
| COMP_2ph | VCC + 0.3 V | -0.3 V | 2 mA | 2 mA |
| CSCOMP_2ph | VCC + 0.3 V | -0.3 V | 2 mA | 2 mA |
| VSN_2ph | GND + 0.3 V | GND - 0.3 V | 1 mA | 1 mA |
| DIFFOUT_2ph / IccMax_2ph | VCC + 0.3 V | -0.3 V | 2 mA | 2 mA |
| VCC | 6.5 V | -0.3 V | 100 mA | 100 mA |
| PVCC | 6.5 V | -0.3 V | 100 mA | 100 mA |
| VRMP | 25 V | -0.3 V | 100 mA | 100 mA |
| SW_x | 35 V 40 V ≤ 50 ns | -5 V | 100 mA | 100 mA |
| BST_x | 35 V wrt / GND 40 V ≤ 50 ns wrt / GND 6.5 V wrt / SW | -0.3 V wrt / SW | 100 mA | 100 mA |
| LG_x / ICCMAX_x | VCC + 0.3 V | -0.3 V -2 V ≤ 200 ns | 100 mA | 100 mA |
| HG_x | BST + 0.3 V | -0.3 V wrt / SW -2 V ≤ 200 ns wrt / SW | 100 mA | 100 mA |
| All Other Pins | VCC + 0.3 V | -0.3 V | 100 mA | 100 mA |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

*All signals referenced to GND unless noted otherwise.

Table 3. THERMAL INFORMATION

| Description | Symbol | Value | Unit |
|---|------------------|--------------|------|
| Thermal Characteristic QFN Package (Note 1) | R _{θJA} | 68 | °C/W |
| Operating Junction Temperature Range (Note 2) | T _J | -40 to +125 | °C |
| Operating Ambient Temperature Range | | -40 to +100 | °C |
| Maximum Storage Temperature Range | T _{STG} | - 40 to +150 | °C |
| Moisture Sensitivity Level QFN Package | MSL | 1 | |

*The maximum package power dissipation must be observed.

NCP81246

GENERAL

Configuration

The NCP81246 is a three-rail IMVP8 controller, with three internal drivers. The NCP81246 is configured with the two-phase, dual-edge controller providing V_Rail2.

Table 8 shows the available configurations, and the pull-down resistor required on Pin 40 (PWM/ ADDR_VBOOT) to configure them.

Table 8. CONFIGURATIONS

Serial VID Interface (Intel proprietary interface)

For Intel proprietary interface communication details please contact Intel[®], Inc.

Ultra-Sonic Mode

Ultra-Sonic Mode forces a minimum switching frequency above audible range when a rail is in DCM mode.

Two-Phase Rail Voltage Compensation

The remote Sense Amplifier output is applied to a Type III compensation network formed by the error amplifier and external tuning components. The non-inverting input of the error amplifier is connected to the same reference voltage used to bias the Remote sense amplifier output.

Two-Phase Rail Remote Sense Amplifier

A high performance high input impedance true differential amplifier is provided to accurately sense the output voltage of the regulator. The VSP and VSN inputs should be connected to the regulator’s output voltage sense points. The remote sense amplifier takes the difference of the output voltage with the DAC voltage and adds the droop voltage to

$$V_{DIFFOUT} = (V_{VSP} - V_{VSN}) + (1.3\text{ V} - V_{DAC}) + (V_{DROOP} - V_{CSREF}) \tag{eq. 1}$$

This signal then goes through a standard error compensation network and into the inverting input of the error amplifier. The non-inverting input of the error amplifier is connected to the same 1.3 V reference used for the differential sense amplifier output bias.

Two-Phase Rail High Performance Voltage Error Amplifier

A high performance error amplifier is provided for high bandwidth transient performance. A standard type III compensation circuit is normally used to compensate the system.

Figure 7. Standard Type III Compensation Circuit

Differential Current Feedback Amplifiers

Each phase of the two-phase rail has a low offset differential amplifier to sense that phase current for current balance and per phase OCP protection during soft-start. The inputs to the CSNx and CSPx pins are high impedance inputs. It is recommended that any external filter resistor RCSN does not exceed 10 kΩ to avoid offset issues with leakage current. It is also recommended that the voltage

sense element be no less than 0.5 mΩ for accurate current balance. Fine tuning of this time constant is generally not required. The individual phase current is summed into the PWM comparator feedback this way current is balanced via a current mode control approach.

$$R_{CSN} = \frac{L_{PHASE}}{C_{CSN} \cdot DCR} \quad (\text{eq. 2})$$

Figure 8.

Two-Phase Rail Total Current Sense Amplifier

The NCP81246 uses a patented approach to sum the phase currents into a single temperature compensated total current signal. This signal is then used to generate the output voltage droop, total current limit, and the output current monitoring functions. The total current signal is floating with respect to CSREF. The current signal is the difference between CSCOMP and CSREF. The Rref(n) resistors sum the signals

from the output side of the inductors to create a low impedance virtual ground. The amplifier actively filters and gains up the voltage applied across the inductors to recover the voltage drop across the inductor series resistance (DCR). Rth is placed near an inductor to sense the temperature of the inductor. This allows the filter time constant and gain to be a function of the Rth NTC resistor and compensate for the change in the DCR with temperature.

Figure 9.

The DC gain equation for the current sensing:

$$V_{CSCOMP-CSREF} = - \frac{R_{CS2} + \frac{R_{CS1} \cdot R_{TH}}{R_{CS1} + R_{TH}}}{R_{PH}} \cdot (I_{OUT_Total} \cdot DCR) \quad (\text{eq. 3})$$

Set the gain by adjusting the value of the R_{PH} resistors. The DC gain should be set to the output voltage droop. If the voltage from CSCOMP to CSREF is less than 100 mV at ICCMAX then it is recommend increasing the gain of the CSCOMP amp. This is required to provide a good current signal to offset voltage ratio for the ILIMIT pin. When no droop is needed, the gain of the amplifier should be set to provide ~100 mV across the current limit programming resistor at full load. The NTC should be placed near the closest inductor. The output voltage droop should be set with the droop filter divider.

The pole frequency in the CSCOMP filter should be set equal to the zero from the output inductor. This allows the circuit to recover the inductor DCR voltage drop current signal. C_{CS1} and C_{CS2} are in parallel to allow for fine tuning of the time constant using commonly available values. It is best to fine tune this filter during transient testing.

$$F_z = \frac{DCR @ 25^\circ C}{2 \cdot \pi \cdot L_{Phase}} \quad (eq. 4)$$

Two-Phase Rail Programming the Current Limit

The current limit thresholds are programmed with a resistor between the ILIMIT and CSCOMP pins. The ILIMIT pin mirrors the voltage at the CSREF pin and mirrors the sink current internally to IOUT (reduced by the IOUT Current Gain) and the current limit comparators. The 100% current limit trips if the ILIMIT sink current exceeds 10 μ A for 50 μ s. The 150% current limit trips with minimal delay if the ILIMIT sink current exceeds 15 μ A. Set the value of the current limit resistor based on the CSCOMP-CSREF voltage as shown below.

$$R_{LIMIT} = \frac{\frac{R_{CS2} + \frac{R_{CS1} \cdot R_{TH}}{R_{CS1} + R_{TH}}}{R_{PH}} \cdot (I_{OUT_{Total}} \cdot DCR)}{10 \mu} \quad (eq. 5)$$

or

$$R_{LIMIT} = \frac{V_{CSCOMP - CSREF @ ILIMIT}}{10 \mu} \quad (eq. 6)$$

Two-Phase Rail Programming DAC Feed-Forward Filter

The DAC feed-forward implementation is realized by having a filter on the VSN pin. Programming R_{VSN} sets the gain of the DAC feed-forward and C_{VSN} provides the time constant to cancel the time constant of the system per the following equations. C_{OUT} is the total output capacitance and R_{OUT} is the output impedance of the system.

Figure 10.

$$R_{VSN} = C_{OUT} \cdot R_{OUT} \cdot 453.6 \cdot 10^6 \quad (eq. 7)$$

$$C_{VSN} = \frac{R_{OUT} \cdot C_{OUT}}{R_{VSN}} \quad (eq. 8)$$

Two-Phase Rail Programming DROOP

The signals CSCOMP and CSREF are differentially summed with the output voltage feedback to add precision voltage droop to the output voltage.

Figure 11.

$$Droop = DCR \cdot \frac{R_{CS}}{R_{PH}} \quad (eq. 9)$$

Two-Phase Rail Programming IOUT

The IOUT pin sources a current in proportion to the ILIMIT sink current. The voltage on the IOUT pin is monitored by the internal A/D converter and should be scaled with an external resistor to ground such that a load equal to ICC_MAX generates a 2 V signal on IOUT. A pull-up resistor from 5 V VCC can be used to offset the IOUT signal positive if needed.

$$R_{IOUT} = \frac{2.0 V \cdot R_{LIMIT}}{10 \cdot \frac{R_{CS2} + \frac{R_{CS1} \cdot R_{TH}}{R_{CS1} + R_{TH}}}{R_{PH}} \cdot (I_{OUT_{ICC_MAX}} \cdot DCR)} \quad (eq. 10)$$

NCP81246

Programming ICC_MAX

A resistor to ground on the IMAX pin programs these registers at the time the part is enabled. 10 μA is sourced from these pins to generate a voltage on the program resistor. The resistor value should be no less than 2 kΩ.

Design Note: Since ICC_MAX is multi-functioned with LG, it is crucial that the LS FET is not turned on during ICC_MAX programming. Source current and maximum

resistor value must not produce a voltage at the FET gate that will turn it on. Keeping the voltage less than 400 mV should be safe.

IccMax_2ph:

$$R_{IccMax2ph} = \frac{IccMax_{2ph} + 32}{127} \cdot 200 \text{ k}\Omega \quad (\text{eq. 11})$$

IccMax_1ph: See Table 10 below.

Table 10. ICCMAX_1PH

| Resistor | 00h (IA) | Resistor | Other 02h/03h |
|----------|----------|----------|---------------|
| 6.8 kΩ | 23 | 5 kΩ | 3 |
| 11 kΩ | 24 | 7.8 kΩ | 4 |
| 14.1 kΩ | 25 | 11 kΩ | 5 |
| 17.2 kΩ | 28 | 14.1 kΩ | 6 |
| 22.6 kΩ | 29 | 17.2 kΩ | 7 |
| 26.5 kΩ | 30 | 20.3 kΩ | 8 |
| 29.5 kΩ | 34 | 23.4 kΩ | 9 |
| 32.8 kΩ | 35 | | |
| 36 kΩ | 36 | | |

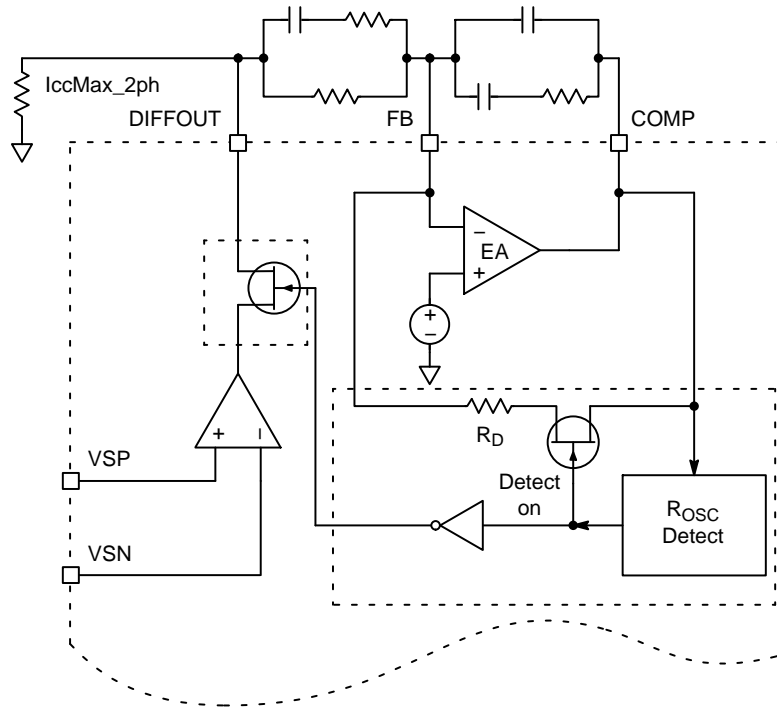

Figure 12.

Programming TSENSE

Temperature sense inputs are provided. A precision current is sourced out the output of the TSENSE pin to generate a voltage on the temperature sense network. The voltage on the temperature sense input is sampled by the

internal A/D converter. A 100 k NTC similar to the VISHAY ERT-J1VS104JA should be used. See the specification table for the thermal sensing voltage thresholds and source current.

Figure 13.

Precision Oscillator

A programmable precision oscillator is provided. The clock oscillator serves as the master clock to the ramp generator circuit. This oscillator is programmed during start-up by a resistor to ground on the LG1/ROSC pin.

The oscillator generates triangle ramps that are 0.5~2.5 V in amplitude depending on the VRMP pin voltage to provide input voltage feed forward compensation.

feed-forward control by varying the ramp magnitude with respect to the VRMP pin voltage. The VRMP pin also has a UVLO function. The VRMP UVLO is only active after the controller is enabled. The VRMP pin is high impedance input when the controller is disabled.

The PWM ramp is changed according to the following,

$$V_{RAMPpk=pkpp} = 0.1 \cdot V_{VRMP} \quad (\text{eq. 12})$$

Programming the Ramp Feed-Forward Circuit

The ramp generator circuit provides the ramp used by the PWM comparators. The ramp generator provides voltage

Figure 14.

Two-Phase Rail PWM Comparators

The non-inverting input of the comparator for each phase is connected to the summed output of the error amplifier (COMP) and each phase current ($I_L \cdot DCR \cdot \text{Phase Balance}$

Gain Factor). The inverting input is connected to the oscillator ramp voltage with a 1.3 V offset. The operating input voltage range of the comparators is from 0 V to 3.0 V and the output of the comparator generates the PWM output.

During steady state operation, the duty cycle is centered on the valley of the sawtooth ramp waveform. The steady state duty cycle is still calculated by approximately V_{OUT}/V_{IN} .

Two-Phase Rail Phase Detection Sequence

During start-up, the number of operational phases and their phase relationship is determined by the internal circuitry monitoring the CSP outputs. Normally, this rail operates as a two-phase VCC_Rail2 PWM controller. If CSP2_2ph is pulled high to VCC, the two-phase rail operates as a single-phase rail.

Disable Single-Phase Rail

If the NCP81246 is to provide fewer than three rails, one or both of the single-phase rails can be disabled by pulling up their respective CSP pin. The main rail cannot be disabled.

Single-Phase Rails

The architecture of the two single-phase rails makes use of a digitally enhanced, high performance, current mode RPM control method that provides excellent transient response while minimizing transient aliasing. The average operating frequency is digitally stabilized to remove

frequency drift under all continuous mode operating conditions. At light load the single-phase rails automatically transition into DCM operation to save power.

Single-Phase Rail Remote Sense Error Amplifier

A high performance, high input impedance, true differential transconductance amplifier is provided to accurately sense the regulator output voltage and provide high bandwidth transient performance. The VSP and VSN inputs should be connected to the regulator’s output voltage sense points through filter networks describe in the Droop Compensation and DAC Feedforward Compensation sections. The remote sense error amplifier outputs a current proportional to the difference between the output voltage and the DAC voltage:

$$I_{COMP} = g_m \cdot (V_{DAC} - (V_{VSP} - V_{VSN})) \quad (\text{eq. 13})$$

This current is applied to a standard Type II compensation network.

Single-Phase Rail Voltage Compensation

The Remote Sense Amplifier outputs a current that is applied to a Type II compensation network formed by external tuning components CLF, RZ and CHF.

Figure 15.

Single-Phase Rail – Differential Current Feedback Amplifier

Each single-phase controller has a low offset, differential amplifier to sense output inductor current. An external lowpass filter can be used to superimpose a reconstruction of the AC inductor current onto the DC current signal sensed across the inductor. The lowpass filter time constant should match the inductor L/DCR time constant by setting the filter pole frequency equal to the zero of the output inductor. This makes the filter AC output mimic the product of AC inductor current and DCR, with the same gain as the filter DC output. It is best to perform fine tuning of the filter pole during transient testing.

$$F_Z = \frac{DCR @ 25^\circ C}{2 \cdot \pi \cdot L_{Phase}} \quad (\text{eq. 14})$$

$$F_P = \frac{1}{2 \cdot \pi \cdot \left(\frac{R_{PHSP} \cdot (R_{TH} + R_{CSSP})}{R_{PHSP} + R_{TH} + R_{CSSP}} \right) \cdot C_{CSSP}} \quad (\text{eq. 15})$$

Forming the lowpass filter with an NTC thermistor (R_{TH}) placed near the output inductor, compensates both the DC gain and the filter time constant for the inductor DCR change with temperature. The values of R_{PHSP} and R_{CSSP} are set

based on the effect of temperature on both the thermistor and inductor. The CSP and CSN pins are high impedance inputs, but it is recommended that the lowpass filter resistance not exceed 10 kΩ in order to avoid offset due to leakage current. It is also recommended that the voltage sense element (inductor DCR) be no less than 0.5 mΩ for sufficient current accuracy. Recommended values for the external filter components are:

$$R_{PHSP} = 7.68 \text{ k}\Omega$$

$$R_{CSSP} = 14.3 \text{ k}\Omega$$

$$R_{TH} = 100 \text{ k}\Omega, \text{ Beta} = 4300$$

$$C_{CSSP} = \frac{L_{PHASE}}{\frac{R_{PHSP} \cdot (R_{TH} + R_{CSSP})}{R_{PHSP} + R_{TH} + R_{CSSP}} \cdot \text{DCR}} \quad (\text{eq. 16})$$

Using 2 parallel capacitors in the lowpass filter allows fine tuning of the pole frequency using commonly available capacitor values.

The DC gain equation for the current sense amplifier output is:

$$V_{CURR} = \frac{R_{TH} + R_{CSSP}}{R_{PHSP} + R_{TH} + R_{CSSP}} \cdot I_{OUT} \cdot \text{DCR} \quad (\text{eq. 17})$$

To improve the noise immunity of the current feedback amplifier, it is recommended to use an RC low pass filter (R_F and C_F in Figure 16) on the CSN pin of the amplifier placed as close as possible to the controller. The bandwidth of this filter should be ~5 MHz with $R_F < 20 \Omega$. To mitigate against noise due to excessive ringing that may be present on the inductor side of R_{PHSP} , it is recommended to use a capacitor in parallel with the inductor. The value of the capacitor should be chosen such that:

$$\sqrt{L \times C} < < \frac{1}{2 \times \pi \times \text{Ringing Frequency}} \quad (\text{eq. 18})$$

Figure 16.

The amplifier output signal is combined with the COMP and RAMP signals at the PWM comparator inputs to produce the Ramp Pulse Modulation (RPM) PWM signal.

Single-Phase Rail – Loadline Programming (DROOP)

An output loadline is a power supply characteristic wherein the regulated (DC) output voltage decreases by a voltage V_{DROOP} proportional to load current. This characteristic can reduce the output capacitance required to

maintain output voltage within limits during load transients faster than those to which the regulation loop can respond. In the NCP81246, a loadline is produced by adding a signal proportional to output load current (V_{DROOP}) to the output voltage feedback signal – thereby satisfying the voltage regulator at an output voltage reduced proportional to load current. V_{DROOP} is developed across a resistance between the VSP pin and the output voltage sense point.

Figure 17.

$$V_{\text{DROOP}} = R_{\text{DRPSP}} \cdot g_m \cdot \frac{R_{\text{TH}} + R_{\text{CSSP}}}{R_{\text{PHSP}} + R_{\text{TH}} + R_{\text{CSSP}}} \cdot I_{\text{OUT}} \cdot \text{DCR} \quad (\text{eq. 19})$$

The loadline is programmed by choosing R_{DRPSP} such that the ratio of voltage produced across R_{DRPSP} to output current is equal to the desired loadline.

$$R_{\text{DRPSP}} = \frac{\text{Loadline}}{g_m \cdot \text{DCR}} \cdot \frac{R_{\text{PHSP}} + R_{\text{TH}} + R_{\text{CSSP}}}{R_{\text{TH}} + R_{\text{CSSP}}} \quad (\text{eq. 20})$$

Single-Phase Rail – Programming the DAC Feed-Forward Filter

The DAC feed-forward implementation for the single-phase rail is the same as for the 2-phase rail. The NCP81246 outputs a pulse of current from the VSN pin

upon each increment of the internal DAC following a DVID UP command. A parallel RC network inserted into the path from VSN to the output voltage return sense point, VSS_SENSE, causes these current pulses to temporarily decrease the voltage between VSP and VSN. This causes the output voltage during DVID to be regulated slightly higher, in order to compensate for the response of the Droop function to the inductor current flowing into the charging output capacitors. R_{FFSP} sets the gain of the DAC feed-forward and C_{FFSP} provides the time constant to cancel the time constant of the system per the following equations. C_{OUT} is the total output capacitance of the system.

Figure 18.

$$R_{\text{FFSP}} = \frac{\text{Loadline} \cdot C_{\text{OUT}}}{1.35 \cdot 10^{-9}} \quad (\Omega) \quad C_{\text{FFSP}} = \frac{200}{R_{\text{FFSP}}} \quad (\text{nF}) \quad (\text{eq. 21})$$

Single-Phase Rail – Programming the Current Limit

The current limit threshold is programmed with a resistor (R_{ILIMSP}) from the ILIM pin to ground. The current limit latches the single-phase rail off immediately if the ILIM pin voltage exceeds the ILIM Threshold. Set the value of the

current limit resistor based on the equation shown below. A capacitor must be placed in parallel with the programming resistor to avoid false trips due to the effect of the output ripple current.

Figure 19.

$$R_{\text{ILIMSP}} = \frac{1.3 \text{ V}}{g_m \cdot \frac{R_{\text{TH}} + R_{\text{CSSP}}}{R_{\text{PHSP}} + R_{\text{TH}} + R_{\text{CSSP}}} \cdot I_{\text{OUT_LIMIT}} \cdot \text{DCR}} \quad (\text{eq. 22})$$

Single-Phase Rail – Programming IOUT

The IOUT pin sources a current in proportion to the ILIMIT sink current. The voltage on the IOUT pin is monitored by the internal A/D converter and should be

scaled with an external resistor to ground such that a load equal to ICCMAX generates a 2 V signal on IOUT. A pull-up resistor from 5 V VCC can be used to offset the IOUT signal positive if needed.

Figure 20.

$$R_{IOUTSP} = \frac{2\text{ V}}{gm \cdot \frac{R_{TH} + R_{CSSP}}{R_{PHSP} + R_{TH} + R_{CSSP}} \cdot I_{ccMax} \cdot DCR} \tag{eq. 23}$$

Single-Phase Rail PWM Comparators

The non-inverting input of each comparator (one for each phase) is connected to the summation of the output of the error amplifier (COMP) and each phase current ($I_L \cdot DCR \cdot \text{Phase Current Gain Factor}$). The inverting input is connected to the triangle ramp voltage of that phase. The output of the comparator generates the PWM output.

A PWM pulse starts when the error amp signal (COMP voltage) rises above the trigger threshold plus gained-up

inductor current, and stops when the artificial ramp plus gained-up inductor current crosses the COMP voltage. Both edges of the PWM signals are modulated. During a transient event, the duty cycle can increase rapidly as the COMP voltage increases with respect to the ramps, to provide a highly linear and proportional response to the step load.

PROTECTION FEATURES

Under Voltage Lockouts

There are several under voltage monitors in the system. Hysteresis is incorporated within the comparators. The NCP81246 monitors the 5 V VCC supply as well as the VRMP pin. The gate drivers monitor both the gate driver VCC and the BST voltage. When the voltage on the gate

driver is insufficient it will pull DRON low and prevents the controller from being enabled. The gate driver will hold DRON low for a minimum period of time to allow the controller to hold off it's start-up sequence. In this case the PWM is set to the MID state to begin soft start.

Figure 21. Gate Driver UVLO Restart

Soft Start

Soft start is implemented internally. A digital counter steps the DAC up from zero to the target voltage based on the predetermined SetVID_SLOW rate in the spec table. The PWM signal will start out open with a test current to collect data on Intel proprietary interface address and V_{BOOT}. After the configuration data is collected, if the

controller is enabled, the internal and external PWMs will be set to 2.0 V MID state to indicate that the drivers should be in diode mode. DRON will then be asserted. As the DAC ramps the PWM outputs will begin to fire. Each phase will move out of the MID state when the first PWM pulse is produced. When a controller is disabled the PWM signal will return to the MID state.

Figure 22. Soft Start

Over Current Latch-Off Protection

Each of the NCP81246 rails compares a programmable current-limit set point to the voltage from the output of its current-summing amplifier. The level of current limit is set with the resistor from the ILIM pin to CSCOMP (two-phase) or to ground (single-phase rails).

Two-Phase Rail Over Current

The current through the external resistor connected between ILIM and CSCOMP is then compared to the internal current-limit threshold. If the current generated through this resistor into the ILIM pin (I_{LIM}) exceeds the internal current-limit threshold, an internal latch-off counter starts, and the controller shuts down if the fault is not removed after 50 μ s (immediately shut down for 150% of current-limit threshold) after which the outputs will remain disabled until the V_{CC} voltage or EN is toggled.

The voltage swing of CSCOMP cannot go below ground. This limits the voltage drop across the DCR through the current balance circuitry. An inherent per-phase current limit protects individual phases if one or more phases stop functioning because of a faulty component. The over-current limit is programmed by a resistor on the ILIM pin. The resistor value can be calculated by the following equations.

Equation related to the NCP81246:

$$R_{ILIM} = \frac{I_{LIM} \cdot DCR \cdot \frac{R_{CS}}{R_{PH}}}{I_{CL}} \quad (\text{eq. 24})$$

Where $I_{CL} = 10 \mu\text{A}$

Figure 23.

Under Voltage Monitor

The output voltage is monitored at the output of the differential amplifier for UVLO. If the output falls more than 300 mV below the DAC–DROOP voltage the UVLO comparator will trip sending the VR_RDY signal low.

Over Voltage Protection

The output voltage is also monitored at the output of the differential amplifier for OVP. During normal operation, if the output voltage exceeds the DAC voltage by 400 mV, the VR_RDY flag goes low, and the output voltage will be ramped down to 0 V. At the same time, the high side gate drivers are all turned off and the low side gate drivers are all turned on. The part will stay in this mode until the V_{CC} voltage or EN is toggled.

NCP81246

Figure 25. OVP Behavior at Start-Up

Figure 26. OVP during Normal Operation Mode

During start-up, the OVP threshold is set to 2.0 V. This allows the controller to start up without false triggering the OVP.

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSIONS: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30mm FROM TERMINAL TIP
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

| MILLIMETERS | | |
|-------------|------|------|
| DIM | MIN | MAX |
| A | 0.80 | 1.00 |
| A1 | 0.00 | 0.05 |
| A3 | 0.20 | REF |
| b | 0.15 | 0.25 |
| D | 6.00 | BSC |
| D2 | 4.60 | 4.80 |
| E | 6.00 | BSC |
| E2 | 4.60 | 4.80 |
| e | 0.40 | BSC |
| K | 0.30 | REF |
| L | 0.25 | 0.45 |
| L1 | 0.00 | 0.15 |
| L2 | 0.15 | REF |
